OSD-H-*-E Series AC Servo Drive

User Manual

Foreword

Thank you for purchasing Optimus Drive OSD-H-*-E series AC Servo drives. This manual will provide information on the OSD-H-*-E series servo products regarding product safety & specifications, installations & wiring, tuning & problem diagnostics.

Please contact us at info@optimusdrive.ru you need further technical support.

Incorrect operation may cause unexpected accident, please read this manual carefully before using product.

- ✧ We reserve the right to modify equipment and documentation without prior notice.
- ✧ We won't undertake any responsibility with any customer's modification of product and the warranty of product will be canceled at the same time.

Safety Precautions

Please read the safety instructions carefully before using the products and Pry attention to the safety signs.

	Might incur death or serious injury
	Might cause injury to operating personals or damage to equipment
	Might cause damage to equipment
	High voltage. Might cause electrocution to personals in contact
	Hot surface. Do not touch
	Protective Earth

Warning

✓The design of the product is not to be used in mechanical system which may incur health hazard.
✓Users should be aware of the product safety precautions during design and installations of the equipment to prevent any unwanted accident.

Safety instructions

Upon receiving

Caution

✓The use of damaged or faulty product(s) is prohibited.
✓Please refer to item checklist. If the labels don't match, please do not install.

Transportation

Caution

- ✓ Please provide storage and transportation under protected conditions.
- ✓ Do not stack the products too high up to prevent toppling.
- ✓ The product should be Packaged properly during transportation,
- ✓ Do not hold the product by the cable, motor shaft or encoder while transporting it.
- ✓ The product should be protected from external forces and shock.

Installation

Caution

Servo drive and Motor:

- ✓ Do not install around combustibles to prevent fire hazard.
- ✓ Avoid vibration and impact.
- ✓ Do not install products that are damaged or incomplete.

Servo drive:

- ✓ Please install in electrical cabinet with sufficient protection from outside elements.
- ✓ Reserve sufficient gap as per the installation guide.
- ✓ Make sure to have good heat sinking.
- ✓ Avoid dust, corrosive gas, conductive object or fluid and combustibles.

Servo Motor:

- ✓ Make sure installation is tight to prevent it from loosening.
- ✓ Prevent fluid from leaking into motor and encoder.
- ✓ Protect motor from impact to avoid damaging encoder.
- ✓ Motor shaft should not bear the load beyond the limits as specified.

Wiring

Warning

- ✓ Participated installation personals should have sufficient training in product installation safety.
- ✓ Please power off and wait for 10 minutes to make sure a full discharge of electricity.
- ✓ Servo drive and motor must be connected to ground.
- ✓ Connect the cables only after servo drive motor installed correctly
- ✓ Make sure the wires are properly managed and insulation layer is not torn to prevent electrocution.

Caution

- ✓ Wiring must be correctly connected to prevent damage to product(s)
- ✓ Servo motor U, V, W terminal should be connected correctly and NOT connected directly to an AC power supply.
- ✓ Capacitors, inductor or filter shouldn't be installed between servo motor and servo drive.
- ✓ Connecting wires or any non-heat-resistant components should be put near to heat sink of the servo drive or motor.
- ✓ The flyback diode which is connected in Parallel to output signal DC relay must not be connected in reverse.

Tuning and running

Caution

✓Make sure the wirings of servo drive and servo motor are installed and fixed properly before powering on.
✓On the first time tuning of the product, it is recommended to run unloaded until all the Parameter settings are confirmed to prevent any damage to the product or machine.

Usage

Caution

- ✓ Please install an emergency stop button on machine to stop operation immediately if there is an accident.
- ✓ Please make sure machine is stopped before clearing an alarm.
- ✓ Servo drive must be matched with specified motor.
- ✓ Frequent restart of the servo system might incur damage to the product.
- ✓ Servo drive and motor will be hot to touch shortly after power off. Please be careful.
- ✓ Modification(s) to servo system is prohibited.

Error Handling

Warning

- ✓ Please wait for 5 minutes after powering off for the electricity to be fully discharged before uninstalling the cables.
- ✓ Participated maintenance personals should have sufficient training in maintenance and operation of this product series.

Caution

✓Please handle the error before clearing an alarm.
- ✓ Keep away from machine after a restart upon alarm. Mechanical axis might suddenly move. Such hazard should be prevented during the utilization of the product.

Model Selection

Caution

- ✓ Rated torque of the servo motor should be higher than continuous designated torque when fully loaded.
- ✓ Load inertia ratio of the motor should be lower or equals to recommended value for specified models
- ✓ Servo drive must be matched with specified motor.

Warranty Information

Available for

Optimus Drive warranty only covers Optimus Drive AC servo products that are obtained through **Optimus Drive certified sales channel**.

Warranty claim

- All Optimus Drive AC servo products (Servo drives and motors) overseas enjoy **18-month** warranty period.
- Due to unforeseen circumstances in different sales regions around the globe, we recommend users to seek technical support from directed sales channel as any warranty claim or repair services may be required.
- Please be informed that any maintenance/repair work that is outside of the warranty claim conditions might incur some charges and to be confirmed before product(s) is being sent in.
- The duration required for maintenance work to be done is to be confirmed after initial check-up but we reserve the right to prolong the repair duration if needed.
- Discontinued products within warranty period will be replaced with a product of similar specifications.

Steps to warranty claim

1. Visit Optimus Drive global site www.OptimusDrive.ru to look for local certified sales channel.
2. Contact designated sales channel to check if any fee might incur. May include repair fee, spare Part cost or shipping cost.

Circumstances where warranty claim is not available

- Damage/Loss due to occurrence of natural or man-made disaster such as fire, flood or earthquake.
- Installation or wiring error
- If there is any modification done to the product
- Warranty label on products is torn or not existing
- Not a product bought from Optimus Drive certified global network of retailers/distributors.

Before warranty claim

- Please backup device Parameter s before any repair work/warranty claim. Optimus Drive and Optimus Drive certified retailers/distributors will not be held responsibilities for any data loss.
- If available, please send product back in original packaging or make sure it is well Packaged to prevent any damage to the product during shipping.

Optimus Drive LLC. and its certified sales channel reserved the final right of the interpretation of the warranty information.

Table of Contents

Chapter 1 Introduction

1.1. Product Introduction

OSD-H-*-E Series AC servo products are high performance AC digital servo which is designed for position/velocity/torque high accurate control with power rating ranging up to 7.5kW which provides a perfect solution for different applications with easy tuning process. Based on the ETG COE + EtherCAT DSP402 protocol, it can be seamlessly connected to controllers/drives that support this standard protocol.

OSD-H-*-E series AC servo drives are using the latest Digital Signal Processing (DSP) chip and Intelligent Power Module (IPM) with compact components integration and great reliability. Using the best PID calculation for Pulse Width Modulation (PWM) control, our OSD-H-*-E series products are the one to beat in this product category.

In comparison to conventional pulse-controlled servo drives, our OSD-H-*-E provides advantages as listed below.

- Lengthen communication range and lower electromagnetic interference

Due to the reliance of pulse command, pulse-controlled servo drives could be easily disrupted by electromagnetic interferences. EtherCAT communication protocol provides fault detections limitations and error handling that makes communication more reliable over long distances.

- Greater motion control

Trajectory generation can be done within the driver under non-cyclic synchronous mode. Controller only needs to deliver target position, velocity and acceleration commands to the driver. Drivers can then achieve greater control by applying feedforward to the commands.

- Simplify complex wiring work

Using EtherCAT communication protocols, the connections between master device and slave stations can be realized using only LAN cables.

- Reduce cost by lowering the requirement for more ports

Multiple axes control can be realized without requirement for more ports or pulse module on the master device/controller. Only a network port is needed to chain the axis controller (drivers) together in series.

1.3. Driver Technical Specification

OSD-H-*-E 220V Models

OSD-H-*-EN series	OSD-H-2SD40E	OSD-H-2SD75E	OSD-H-2S1D0E	OSD-H-2S1D5E	OSD-H-2S2D0E
Rated power (W)	400	750	100	1500	2000
Rated Current (Arms)	3.5	5.5	7	9.5	12
Peak Current (Arms)	9.2	16.6	18.7	31.1	36
Size (mm)	40*175*156	50*175*156		80*175*179	
Main Power Supply	Single phase AC 220V, -15%~+10%, 50/60Hz				
Control Circuit Power Supply					

OSD-H-*-E 400V Models

OSD-H-*-E series	OSD-H-4TD75E	OSD-H-4T1D0E	OSD-H-4T1D5E	OSD-H-4T2D0E	OSD-H-4T3T0E
Rated Power(W)	750	1000	1500	2000	3000
Rated Current (Arms)	2.7	3.5	5.4	8.4	11.9
Peak Current (Arms)	8.6	10.6	14.9	24.8	33.2
Size (mm)	55*175*179			80*175*179	
Main Power Supply	Three phase AC 380V~440V, -15%~+10%, 50/60Hz				
Control Circuit Power Supply	Single phase AC 380V~440V, -15%~+10%, 50/60Hz				

OSD-H-*-ENT series	OSD-H-4T4D4*	OSD-H-4T5D5*	OSD-H-4T7D5*
Rated Power(W)	4400	5500	7500
Rated Current (Arms)	16.5	20.8	25.7
Peak Current (Arms)	38.9	51.6	63.6
Size (mm)	89*250*230		
Main Power Supply	Three phase AC 380V~440V, -15%~+10%, 50/60Hz		
Control Circuit Power Supply	Single phase AC 380V~440V, -15%~+10%, 50/60Hz		

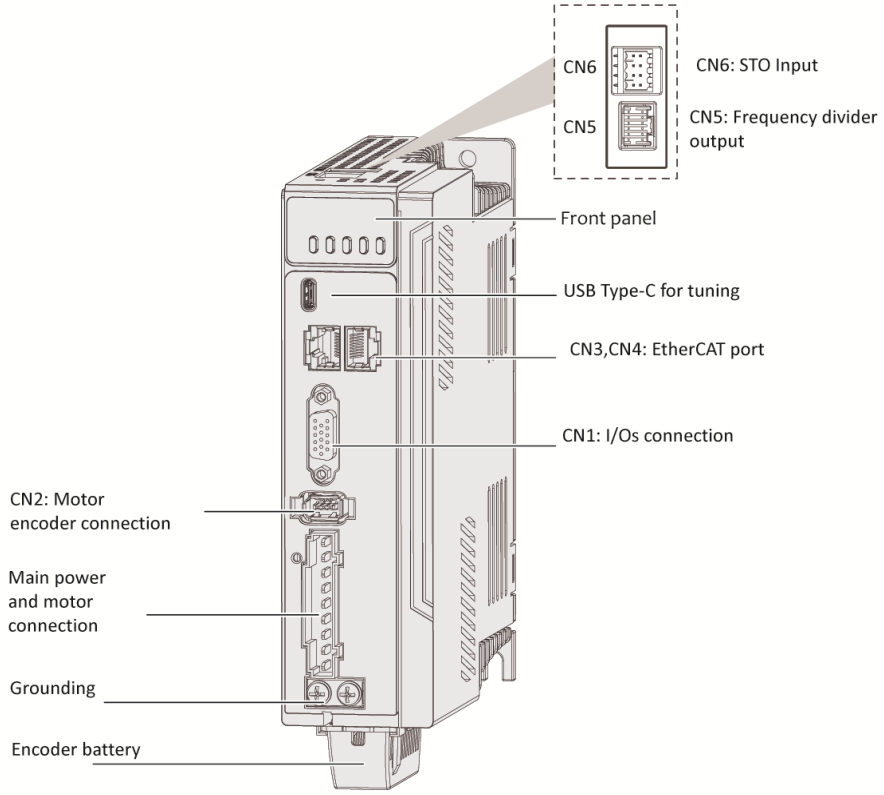
Drive mode			IGBT PWM sinusoidal wave drive
Control mode		Position	Profile Position Mode (PP)
			Cyclic Synchronous Position Mode (CSP)
			Homing Mode (HM)
		Velocity	Profile Velocity Mode (PV)
			Cyclic Synchronous Velocity Mode (CSV)
		Torque	Profile Torque Mode (PT)
			Cyclic Synchronous Torque Mode (CST)
Encoder Feedback			RS485 protocol: 23-bit multiturn absolute magnetic/optical encoder
	Digital Input		4 Digital Inputs (Supports NPN and PNP)
		Configurable input signals under EtherCAT mode:	1. Clear Alarm （A-CLR） 2. Positive limit switch (POT) 3. Negative limit switch (NOT) 4. Homing switch (HOME-SWITCH) 5. Emergency stop (E-Stop)
			3 Digital Outputs (2 single-ended, 1 differential)

I/O	Digital Output	Configurable output signals under EtherCAT mode:	1. Alarm (ALM) 2. Servo ready (SRDY) 3. External brake off (BRK-OFF) 4. Positioning completed (INP) 5. Velocity at arrival (AT-SPEED) 6. Torque limiting command (TLC) 7. Zero speed position (ZSP) 8. Velocity coincidence (V-COIN) 9. Position command (P-CMD) 10. Velocity limit (V-LIMIT) 11. Velocity command (V-CMD) 12. Servo enabled (SRV-ST) 13. Homing done (HOME-OK)
	Encoder Output	Encoder ABZ differential pulse output	

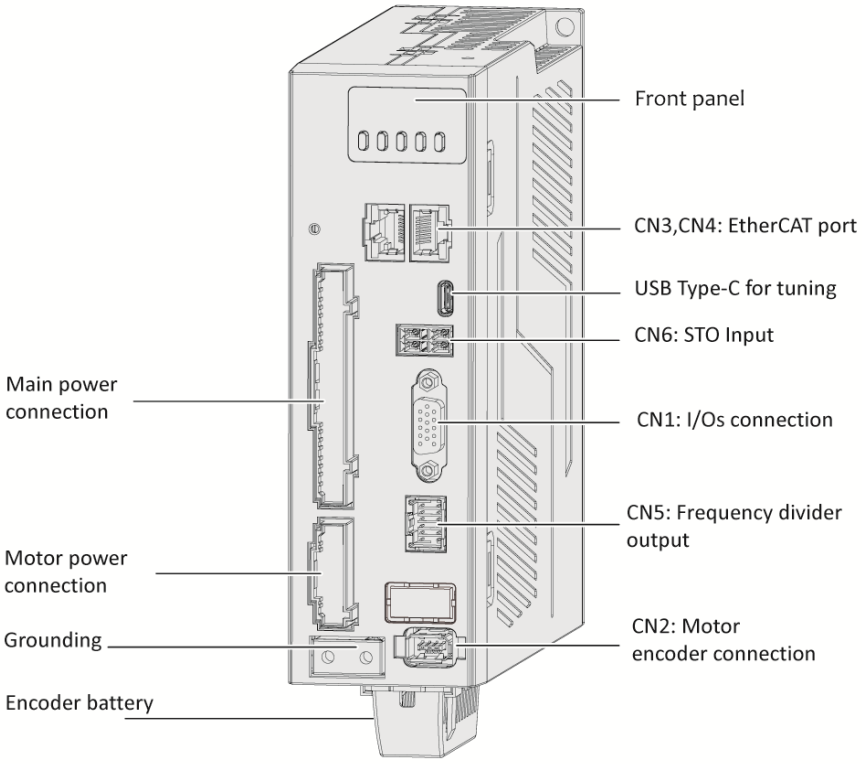
	Probe Input	2 high speed probe inputs: EXT1+/EXT1-, EXT2+/EXT2-
Communication Port	USB Type-C	Modbus USB2.0 (No need to connect driver to power supply)
	EtherCAT	EtherCAT Communication up to 128 axes to a host
Software		Driver tuning through Optimus Tuning software Ver. 2.2.x. Parameter s tuning in current loop, position loop, velocity loop; Modify I/O signal and motor Parameter s; Variables (velocity, position deviation, etc.) monitoring using step diagrams
Driver Front Panel		5 push buttons and 8-segments display
Holding brake		Built-in (Supports external brake)
Safety Protection		Overcurrent. Overvoltage. Undervoltage. Overheat. Overload. Overtravel. Single-Phasing. Regenerative resistor error. Position deviation error. Encoder feedback error. Excessive braking rate. EEPROM error
Safe Torque Off (STO) function		Available for all OSD-H-*-E series products
Environment	Temperature	Storage: -20-80℃ (Condensation free); Installation: 0-55℃ (Not frozen)
	Humidity	Under 90%RH (Condensation free)
	Altitude	Up to 1000m above sea level
	Vibration	Less than 0.5G (4.9m/s2) 10-60Hz (non-continuous working)
	IP ratings	IP20

1.4. Driver ports and connectors

OSD-H-E Series Servo Drive 220V Models



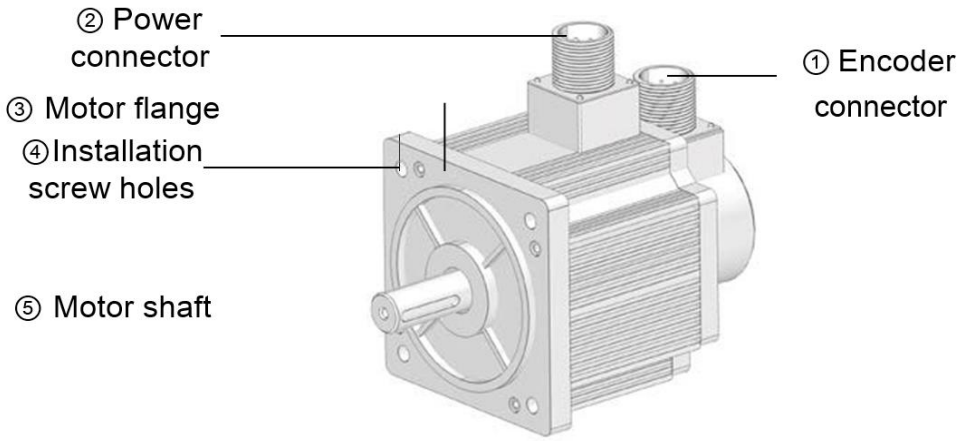
OSD-H-E Series Servo Drive 400V Models



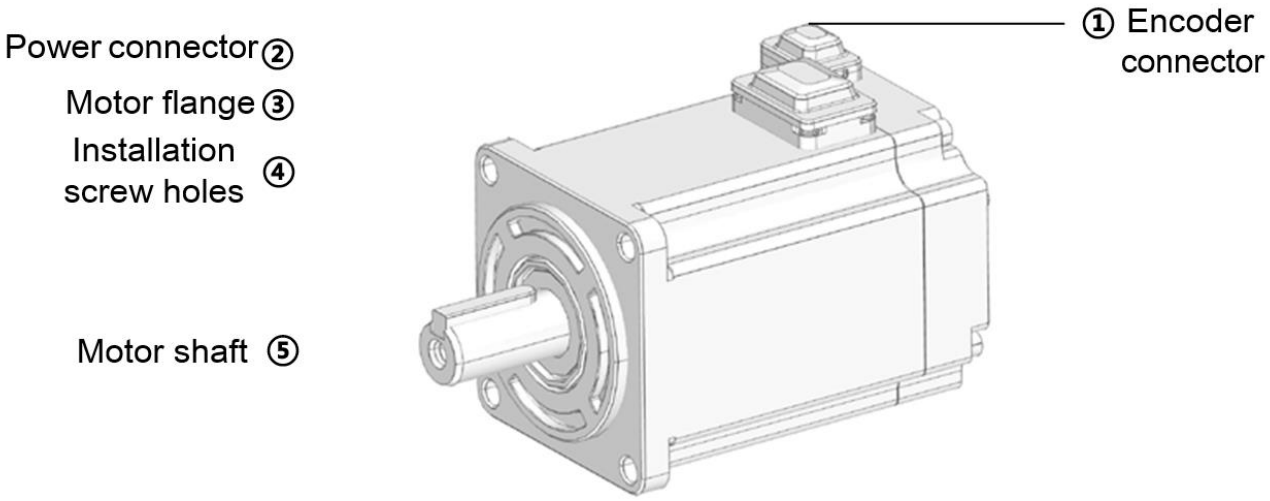
No.	Parts & Connectors	Description
①	Front Panel	Including a LED display and 5 buttons. LED display is used to display servo drive status and Parameter settings. 5 buttons： M ： *To switch between different modes and Parameter s* ◀ ： *Switch between value* ▲ ： *Switch between sub-menus/Increase* ▼ ： *Switch between sub-menus/Decrease* S : *Enter*
②	USB Type-C tuning port	Connect to computer for tuning of servo drive. Parameter s of the servo drive can be modified without connecting to main power supply.
③	CN1 I/O signal	Probe input signal & other I/O signals terminals
④	CN3 EtherCAT IN/ CN4 EtherCAT OUT	Connect to master device or next/previous slave station
⑤	CN6 STO	Safe Torque Off (STO) port
⑥	CN2 Encoder	Connect to motor encoder
⑦	Power-on indicator light	Lights up when servo drive is connected to main power supply. *Please do not touch the power terminal immediately after power off as the capacitors might require some time to discharge.*
OSD-H-*-E 220V models		
⑧	L1, L2	Main power supply 220VAC
	P+, Br	Connect to regenerative resistor
	P+, N	Common DC bus terminals for multiple drivers
	U, V, W	Motor connector: Connect to U, V, W power terminals on servo motor
	PE	PE motor earth terminal: Connect to motor PE terminal
OSD-H-*-E 400V models		
⑧ ⑨ ⑩	L1C, L2C	Control circuit power supply input – 1ph 380VAC
	R, S, T	Main power supply input – 3ph 380VAC
	P+	DC bus positive terminal. Connect to regenerative resistor
	B1, B2	Please short connect B1 and B2 when using internal regenerative resistor. If external regenerative resistor is required, remove the short connector between B1 and B2, connect the external regenerative resistor to P+ and B2.
	N	DC bus negative terminal. Do not connect.
	N1, N2 (4.4/5.5/7.5kW models)	N1 and N2 are short connected. Connect N1 and N2 after removing short connector to a DC reactor to suppress electrical current high harmonics.
⑪	Protective Earth PE	Connect to PE of main power supply. For grounding

1.5. Motor ports and connectors

Motors with aviation connectors



Motors with direct connectors



Chapter 2 Installation & Wiring

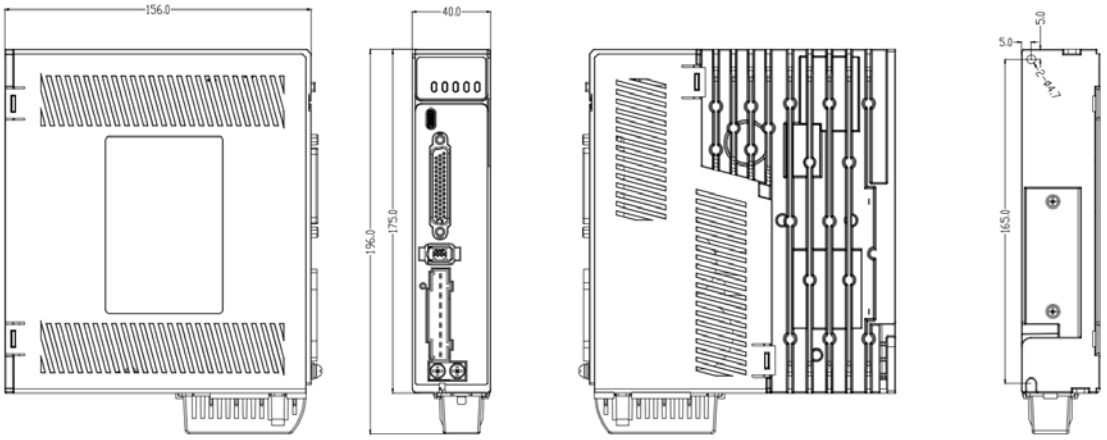
2.1 Servo Drive Installation

2.1.1 Servo drive installation environment

Temperature	Storage: -20-80℃ (Condensation free); Installation: 0-55℃ (Not frozen)
Humidity	Under 90%RH (Condensation free)
Altitude	Up to 1000m above sea level
Vibration	Less than 0.5G (4.9m/s2) 10-60Hz (non-continuous working)
Atmospheric	No corrosive gas, combustibles, dirt or dust.
IP ratings	IP20

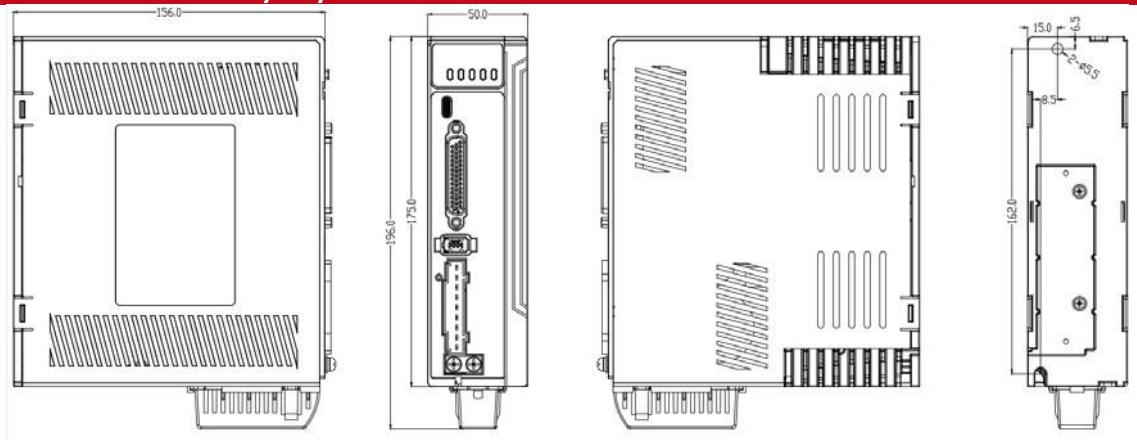
2.1.2 Servo Drive Dimension

Dimension 1: OSD-H-2SD40



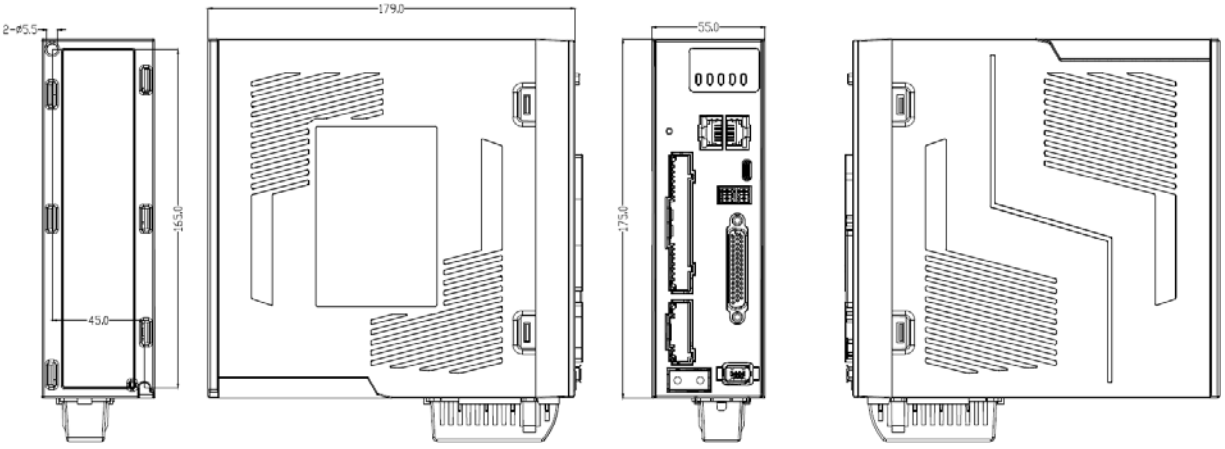
175mm x 156mm x 40mm

Dimension 2: OSD-H-2SD75/1D0/1D5



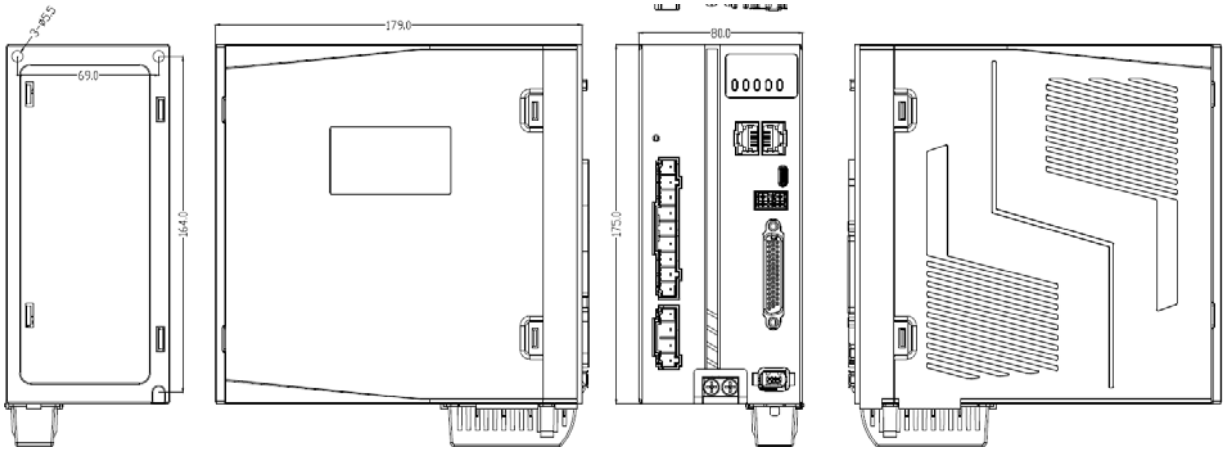
175mm x 156mm x 50mm

Dimension 3: OSD-H 4T D75/1D0/1D5



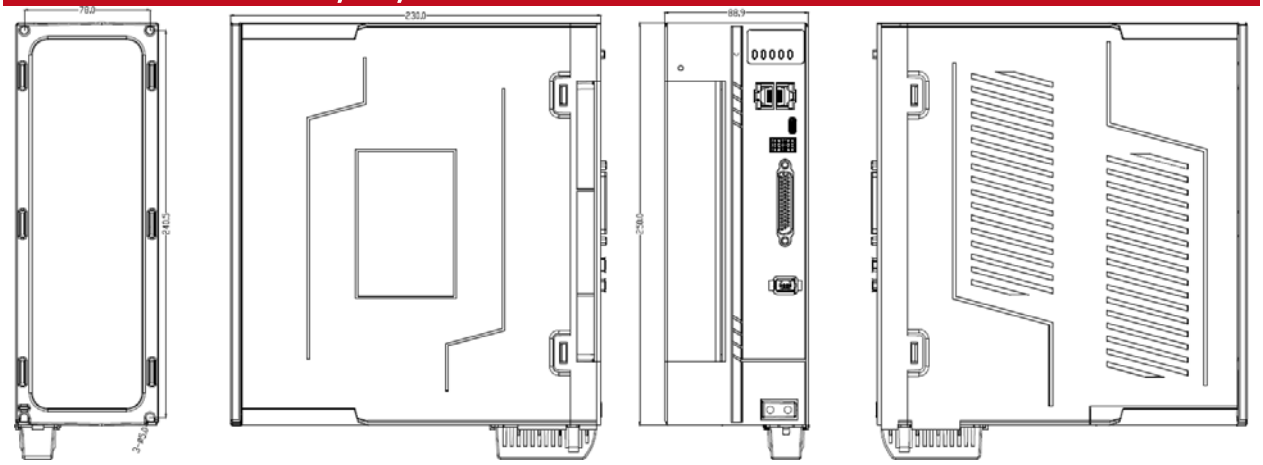
175mm x 179mm x 55mm

Dimension 3: OSD- 4T 2D0/3D0 - OSD- 2S 1D5/2D5



175mm x 179mm x 85mm

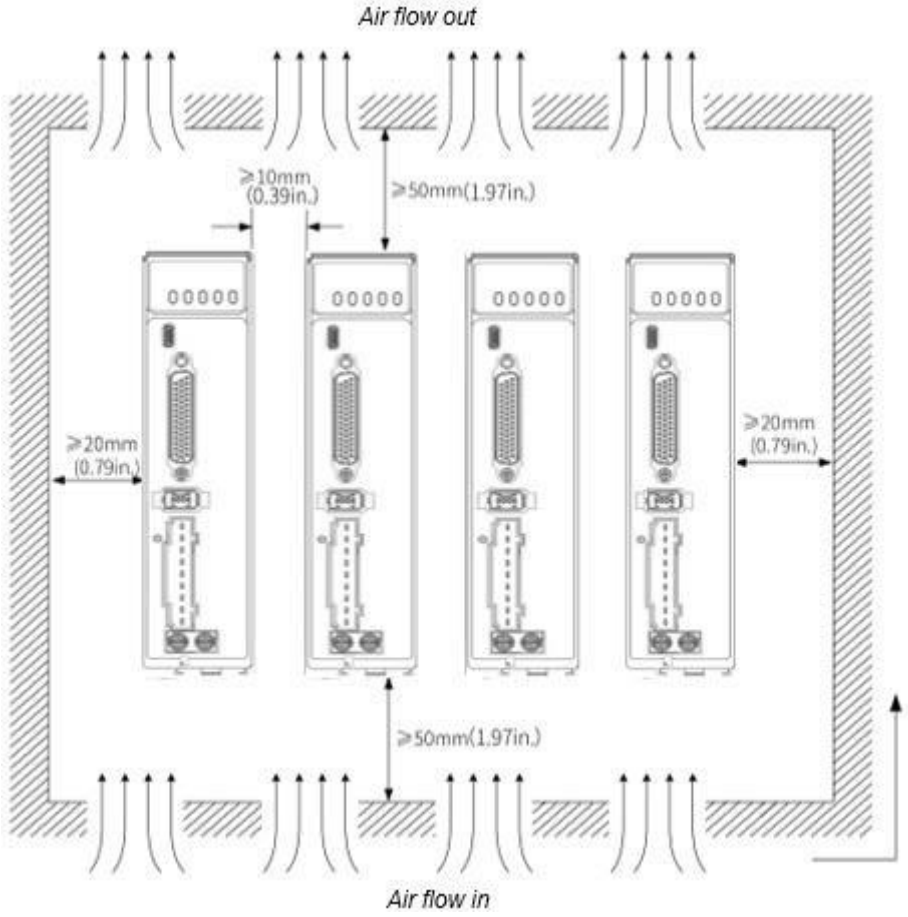
Dimension 3: OSD- 4T 4D4/5D5/7D5



250mm x 230mm x 89mm

Space requirement for installation

In order to ensure efficient heat dissipation, please leave at least 10mm installation space in between drivers. If drivers need to be mounted compactly, please leave at 1mm of installation space. Please keep in mind that under such conditions, the drivers can only run at 75% of actual load rate.



- **Installation method**
  Please install the driver vertical to ground facing forward for better heat dissipation. Always install in rows and use heat insulation board to separate between rows.
  Cooling fans are recommended for drivers to achieve optimal performance.
- **Grounding**
  PE terminals must be grounded to prevent electrocution hazard or electromagnetic interference.
- **Wiring**
  Please ensure there is no liquid around the wiring and connectors as liquid leakage may cause serious damage to the driver(s).
- **RJ45 port cover**
  Please cover unconnected RJ45 port(s) on top of the driver to prevent dust or liquid from damaging the ports.
- **Battery kit**
  If there is a need for battery kit, please remember to leave a room in the electrical cabinet for it.

2.2 Servo Motor Installation

2.2.1 Installation conditions

Installation conditions may affect the lifespan of a motor

- Please keep away from corrosive fluid and combustibles.
- If dusty working environment is unavoidable, please use motors with oil seal.
- Please keep away from heat source.
- If motor is used in enclosed environment without heat dissipation, motor lifespan will be short.
- Please check and clean the installation spot before installation.

2.2.2 Precautions during installation

Installation method

Install horizontal to ground

Make sure power cable and encoder cable is facing downwards to make sure fluid doesn't leak into the ports.

Install vertical to ground

Please use a motor with oil seal when paired with a reducer to prevent reducer oil from leaking into the motor.

Oil- and waterproofing

- Do not submerge motor/cable under oil/water
- Please use a motor with oil seal when paired with a reducer to prevent reducer oil from leaking into the motor.
- If there is an unavoidable fluid leakage near the motor, please use motor with better IP ratings.
- Make sure power cable and encoder cable is facing downwards to make sure fluid doesn't leak into the ports.
- Avoid the usage of motor in water/oil leaking prone environment.

Cable under stress

- Do not the bend the cable especially at each end of the connectors.
- Make sure to not let the cables be too tight and under tremendous stress especially thinner cables such as signal cables.

Connectors

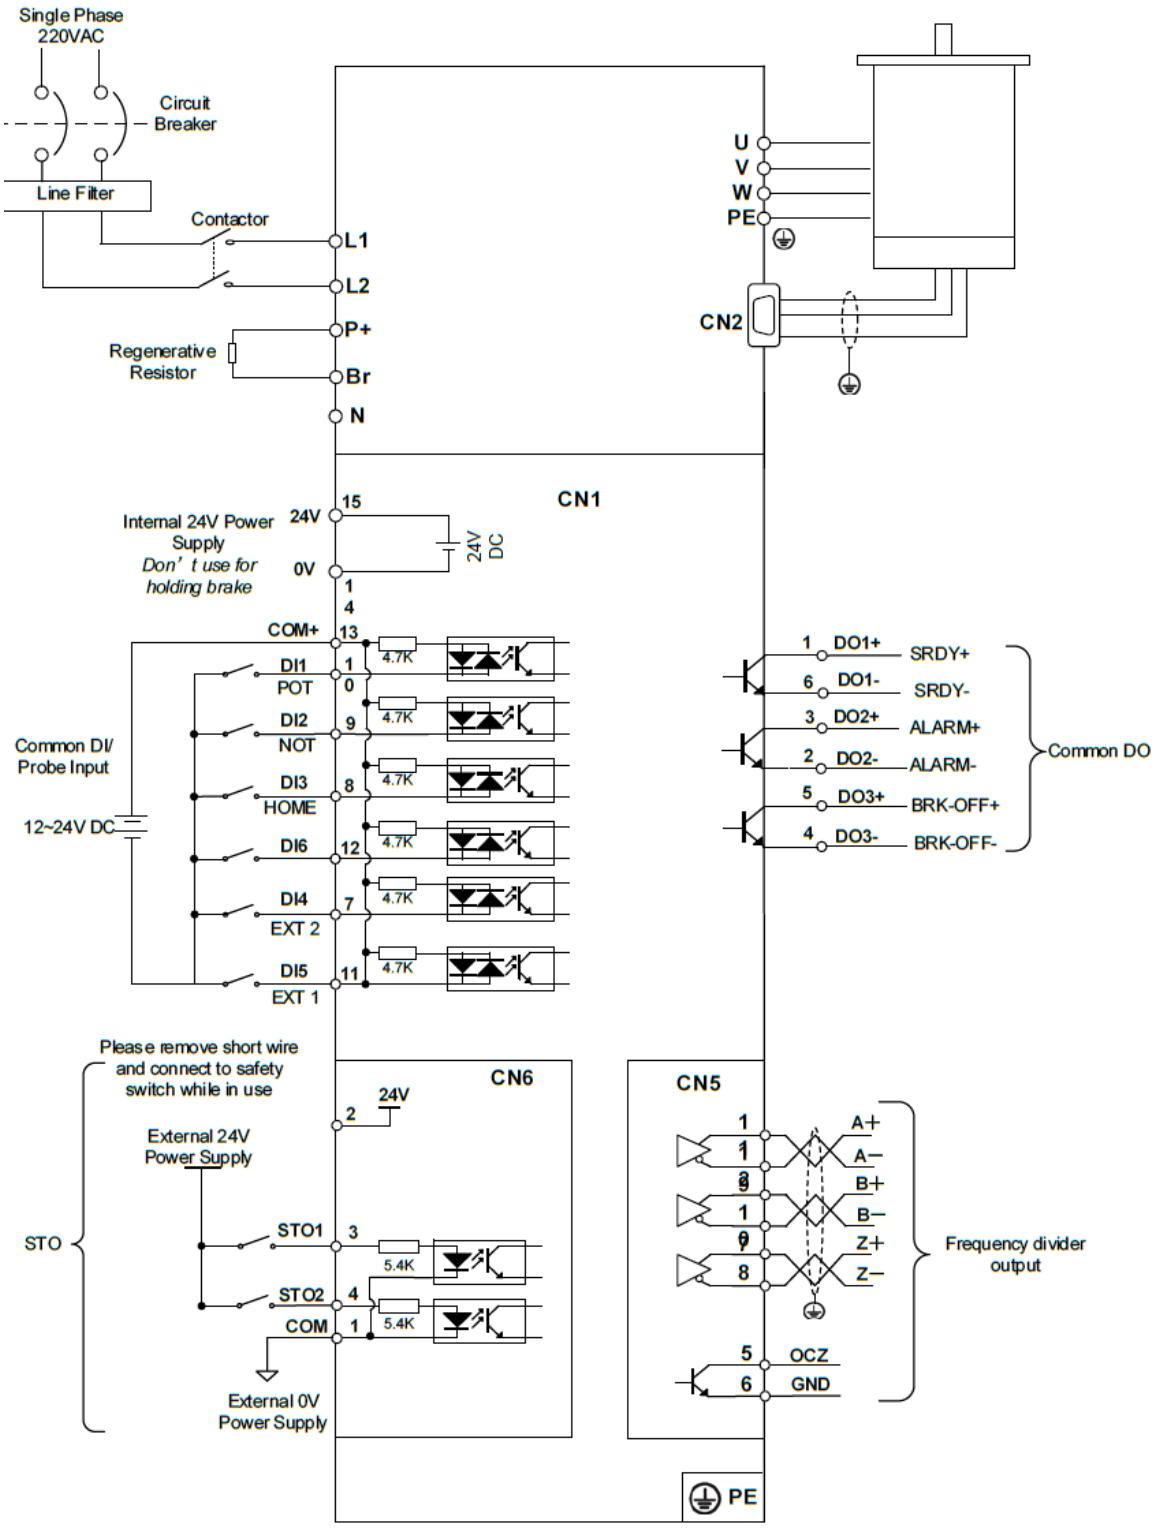
- Please to remove any conductive foreign objects from the connectors before installation
- The connectors are made of resin. May not withstand impact.
- Please hold the driver during transportation, not the cables.
- Leave enough "bend" on the connector cables to ensure less stress upon installation.

Encoder & coupling

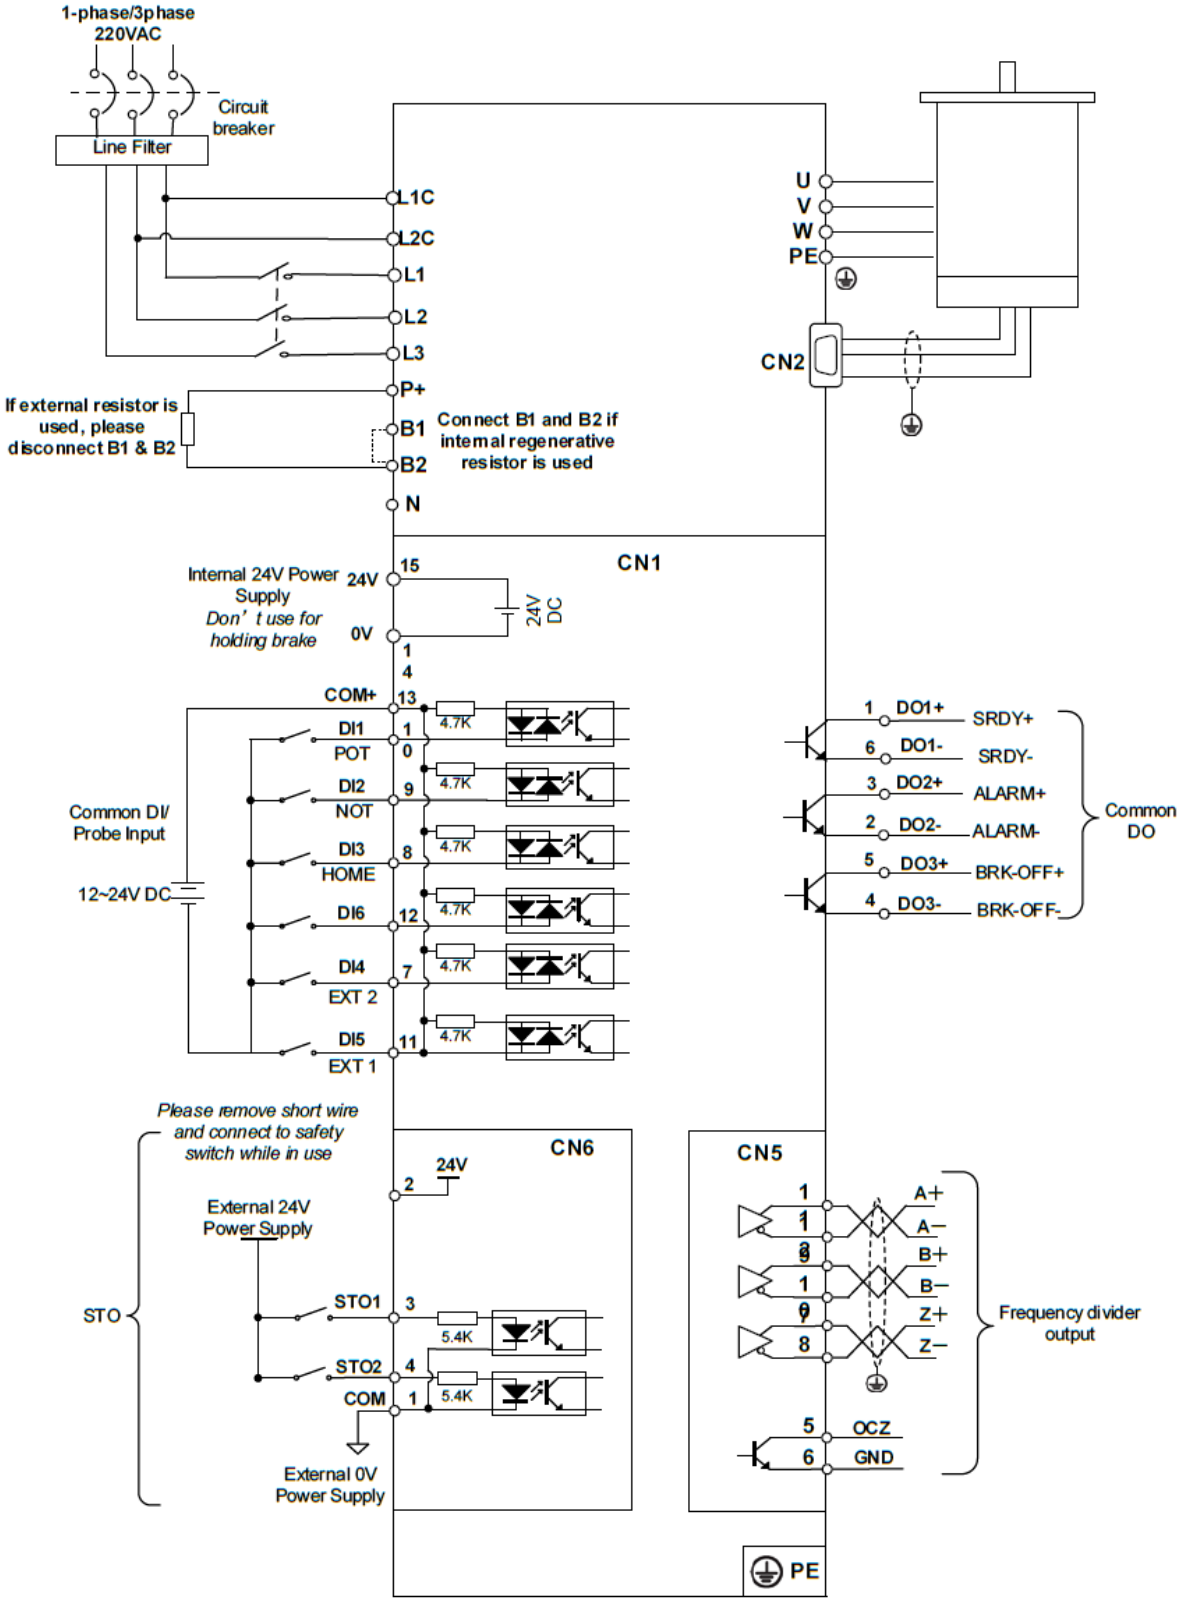
- During installation or removal of coupling, please do not hit the motor shaft with a hammer as it would cause damage to internal encoder.
- Please make sure to centralize the motor shaft and coupling, it might cause damage to motor or encoder due to vibration.
- Please make sure axial and radial load is within the limits specified as it might affect the lifespan of the motor or cause damage to it.

2.3 OSD-H-*-E Wiring Diagram

OSD-H-*-E Series 400W/750W/1000W – 220V Models



OSD-H-*-E Series 1500W/2000W – 220V Models



OSD-H-*-E Series 750W/1000W/1500W/2000W/3000W – 400V Models

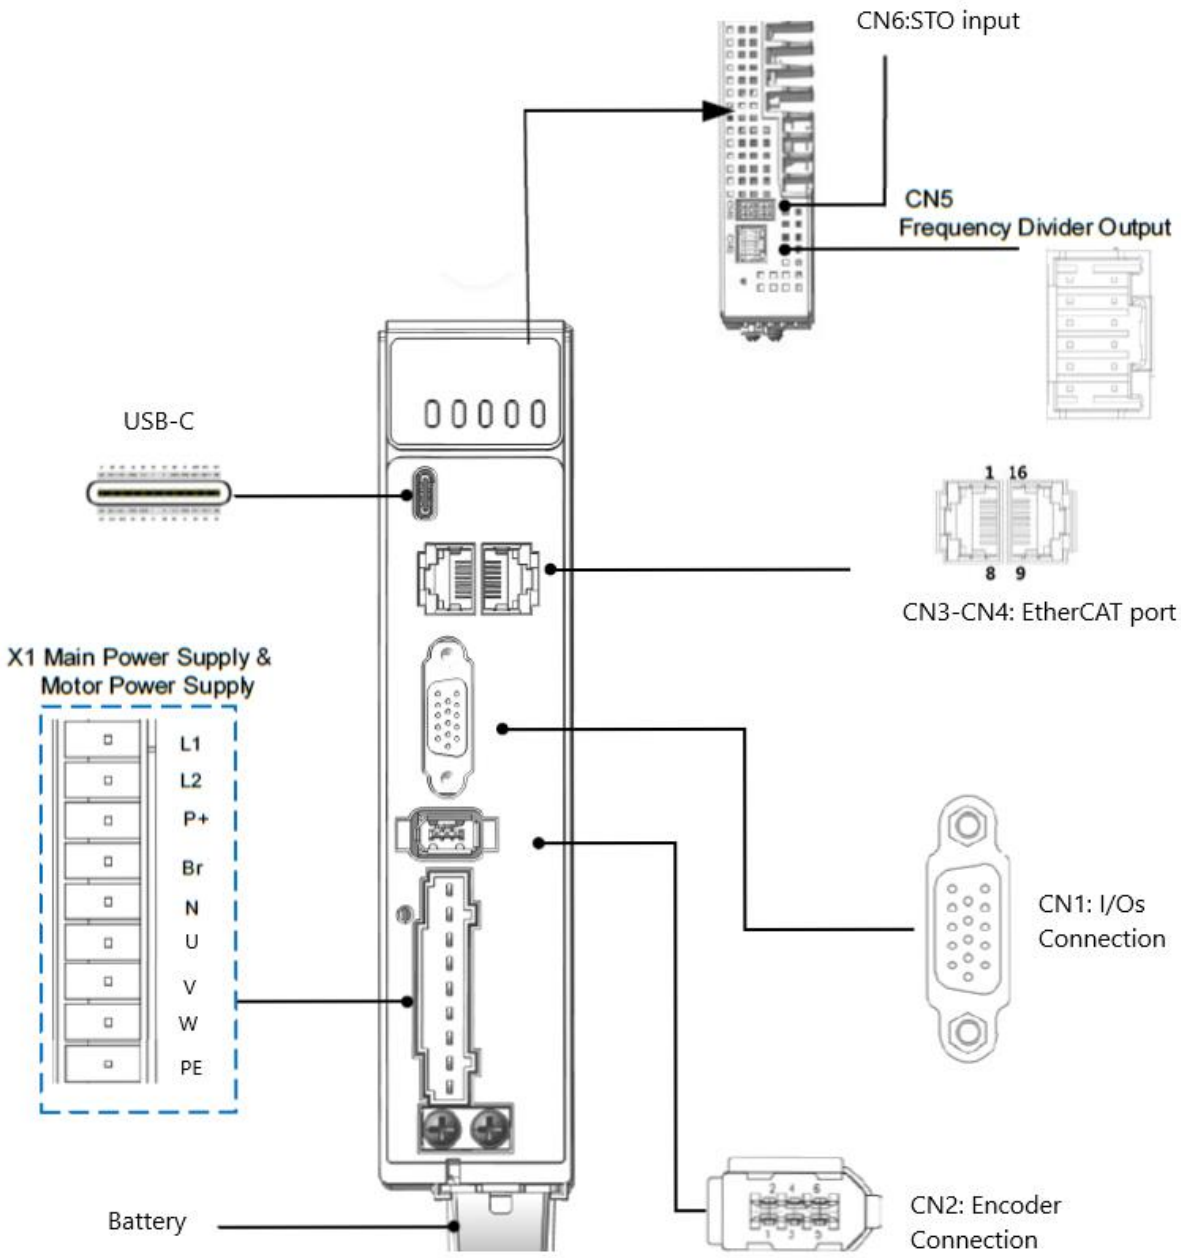
2.4 Servo Drive Ports



Port	Function
CN1	I/O Signal Port
CN2	Encoder port
USB	USB Type-C Tuning Port
CN3	EtherCAT IN Communication Port
CN4	EtherCAT OUT Communication Port
CN6	Safe Torque Off (STO) Port
X1	Main Power Supply

2.4.1 X1 Main power supply

OSD-H-*-E Series – 220V Models

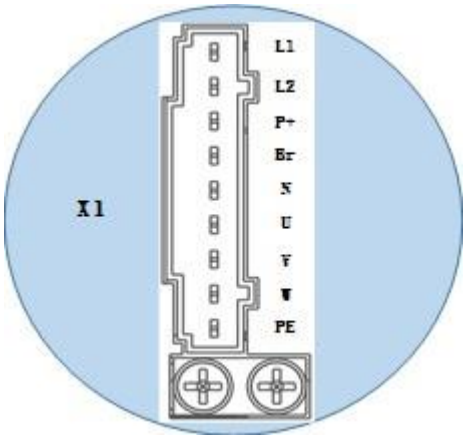


Table 2-2 X1 port descriptions

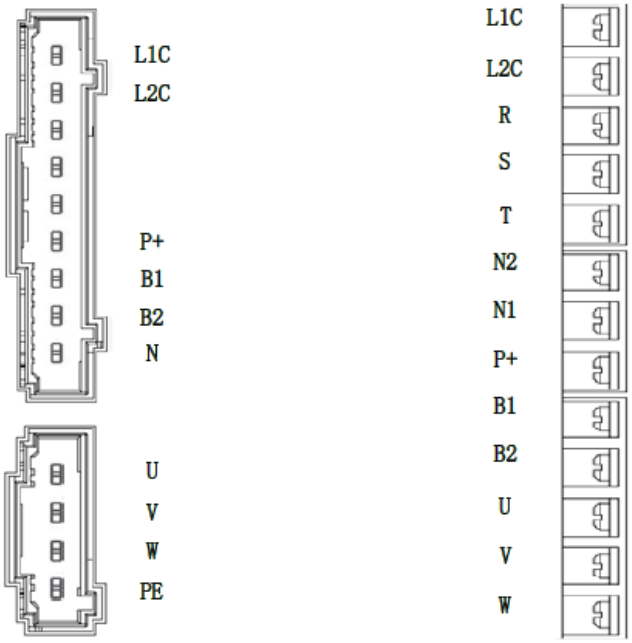
Port	Pin	Functions	Remarks
X1	L1	Single phase 220VAC, +10～-15%, 50/60Hz	① Optional isolation transformer ② Do not connect to 380VAC directly to prevent damage to driver. ③ in case of serious interference, it is recommended to connect a line filter to main power supply; *It is recommended to install a fuseless circuit breaker to cut off power supply in time when the driver fails.*
	L2		
	P +	① Internal DC bus positive terminal ② External regenerative resistor P terminal	*Please refer to 2.4.1 Regenerative resistor selection and connections*
	Br	External regenerative resistor terminal	
	N		Please do not connect
	U	Motor U terminal	Please ensure proper wire connection on motor.
	V	Motor V terminal	
	W	Motor W terminal	
	PE	Motor Protective Earth	Please ground PE of driver and motor together

OSD-H-*-E Series – 400V Models



Port	Pin	Functions	Remarks
X1	L1C	Control circuit: Single phase 400VAC, +10～-15%，50/60Hz	① Optional isolation transformer ② In case of serious interference, it is recommended to connect a line filter to main power supply; *It is recommended to install a fuseless circuit breaker to cut off power supply in time when the driver fails.*
	L2C		
	R	Main Power Supply: Three phase 400VAC, +10～-15%，50/60Hz	
	S		
	T		
	P +	③ Internal DC bus positive terminal ④ External regenerative resistor P terminal	If an external regenerative resistor is required, please disconnect B1 and B2. Connect the external regenerative resistor to terminal P+ and B2.
	B1/B2	External regenerative resistor terminal	
	N	Internal DC bus negative terminal	Please do not connect
	N1		N1 and N2 are connected under normal circumstances. To suppress power supply high harmonics, please disconnected N1 and N2. Connect a DC reactor between N1 and N2.
	N2		
	U	Motor U terminal	Please ensure proper wire connection on motor.
	V	Motor V terminal	
	W	Motor W terminal	
	PE	Motor Protective Earth	Please ground PE of driver and motor together

2.4.2 Regenerative resistor selection and connections

The use of regenerative resistor

When the motor opposes the direction of rotation as in deceleration or vertical axis escalation, Part of the regenerative energy will be delivered back to the driver. This energy will first be stored in internal capacitors of the driver. When the energy stored in the capacitors reach the maximum capacity, a regenerative resistor is required the excessive energy to prevent over-voltage.

Selection of regenerative resistor

Table 2-3 Recommended selection of regenerative resistor

Model no.	Internal resistance (Ω)	Internal resistor power rating (W)	Minimum resistance (Ω)	Minimum power rating (W)
OSD-H-2SD40E	100	50	50	50
OSD-H-2SD75E	50	75	40	50
OSD-H-2S1D0E	50	100	30	100
OSD-H-4TD75E	100	100	100	100
OSD-H-4T1D0E	100	100	100	100
OSD-H-4T1D5E	100	100	100	100
OSD-H-4T2D0E	50	100	40	100
OSD-H-4T3D0E	50	100	40	100
OSD-H-4T4D4E	35	100	35	100
OSD-H-4T5D5E	35	100	25	100
OSD-H-4T7D5E	35	100	25	100

Calculation of regenerative resistance under normal operation

Steps:

1. Determine if driver comes with a regenerative resistor. If not, please preparer a regenerative resistor with resistance value higher than might be required.
2. Monitor the load rate of the regenerative resistor using front Panel (d14). Set the driver on high velocity back and forth motions with high acceleration/deceleration. 3.Please make sure to obtain the value under following conditions: Driver temperature < 60°C, d14<80(Won't trigger alarm), Regenerative resistor is not fuming, No overvoltage alarm (Err120).

Pb (Regenerative power rating) = Resistor power rating x Regenerative load rate (%)

Please choose a regenerative resistor with power rating Pr about 2-4 times the value of Pb in considered of harsh working conditions and some 'headroom'.

If the calculated Pr value is less than internal resistor power rating, external resistor is not required.

R (Max. required regenerative resistance) = $(380^2 – 370^2)/Pr$

Problem diagnostics related to regenerative resistor:

- If driver temperature is high, reduce regenerative energy power rating or use an external regenerative resistor.

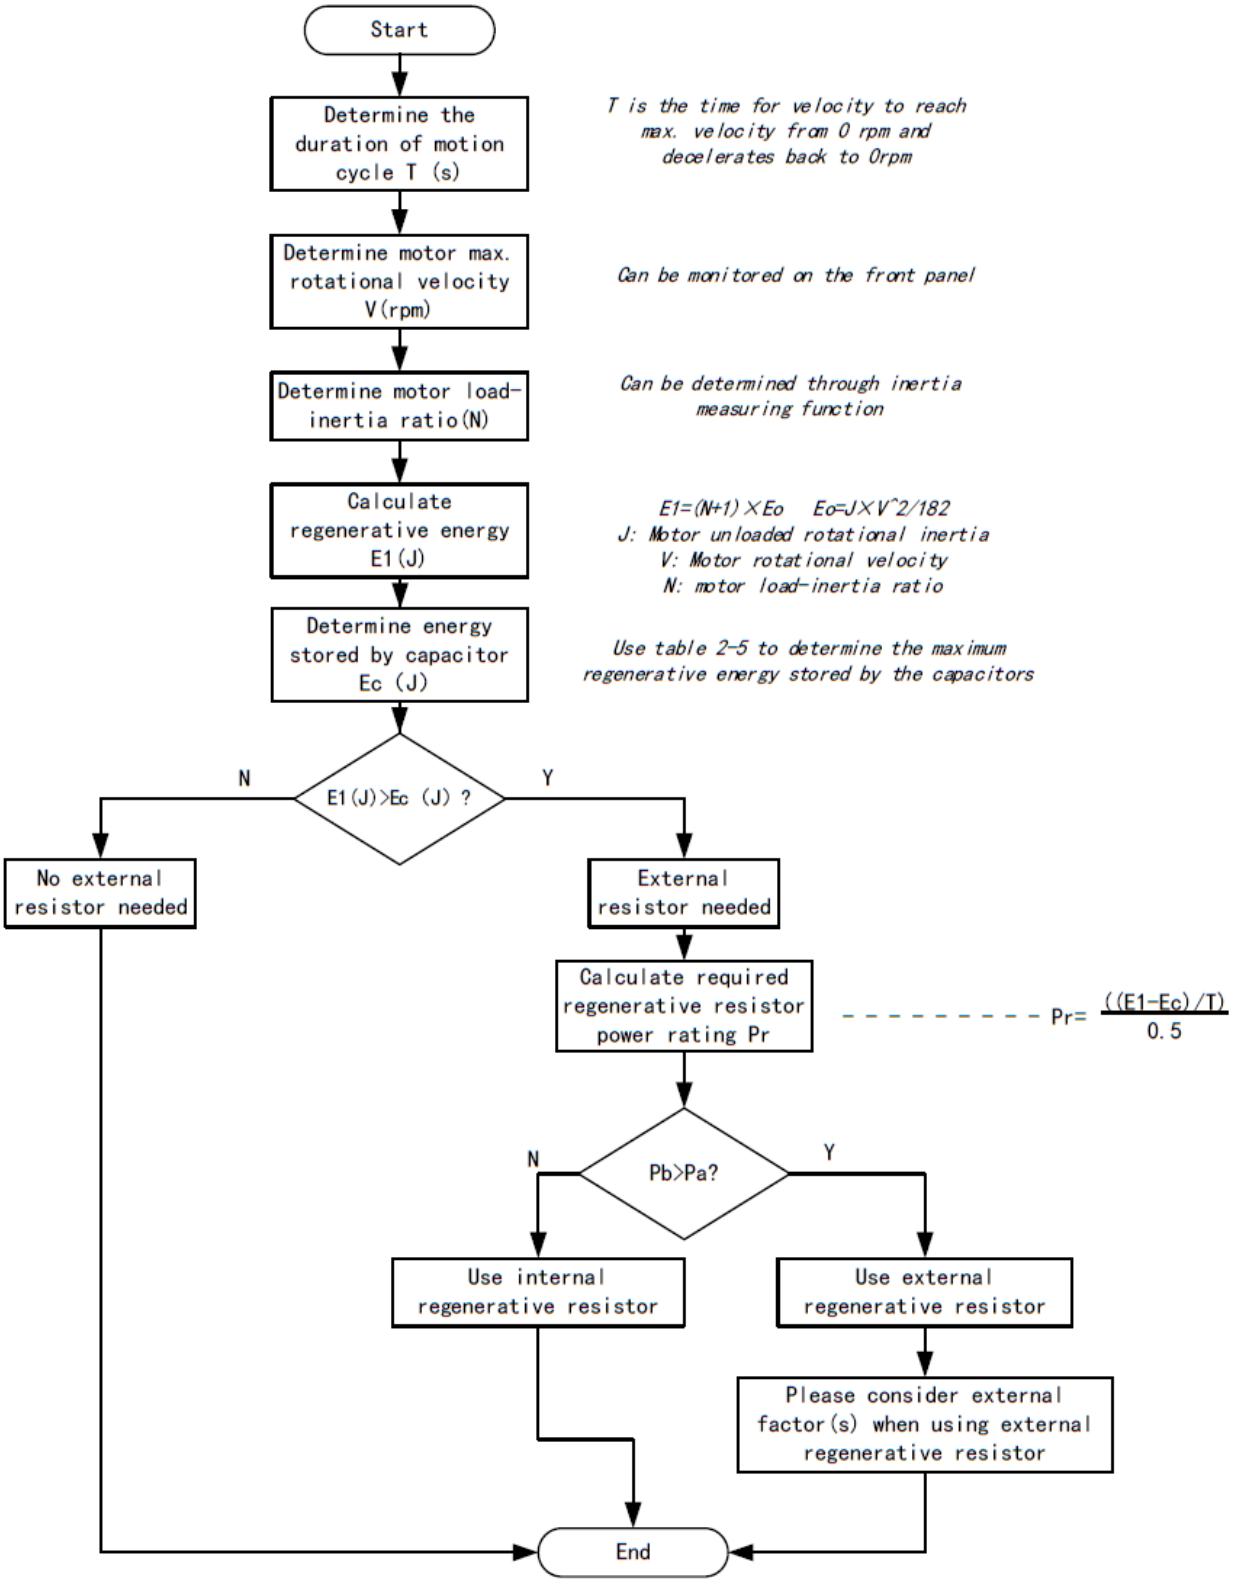
- If regenerative resistor is fuming, reduce regenerative energy power rating or use an external regenerative resistor with higher power rating.
- If d14 is overly large or increasing too fast, reduce regenerative energy power rating or use an external regenerative resistor with higher power rating.
- If driver overvoltage alarm (Er120) occurs, please use an external regenerative resistor with lower resistance or connect another resistor in Parallel.

Please take following precautions before installing an external regenerative resistor.

1. Please set the correct resistance value in Pr0.16 and resistor power rating Pr0.17 for the external regenerative resistor.
2. Please ensure the resistance value is higher or equals to the recommended values in table 2-3. Regenerative resistors are generally connected in series but they can also be connected in Parallel to lower the total resistance.
3. Please provided enough cooling for the regenerative resistor as it can reach above 100℃ under continuous working conditions.
4. The min. resistance of the regenerative resistor is dependent on the IGBT of the holding brake. Please refer to table

Theoretical selection of regenerative resistor

Without external loading torque, the need for an external regenerative resistor can be determined as the flow chart below



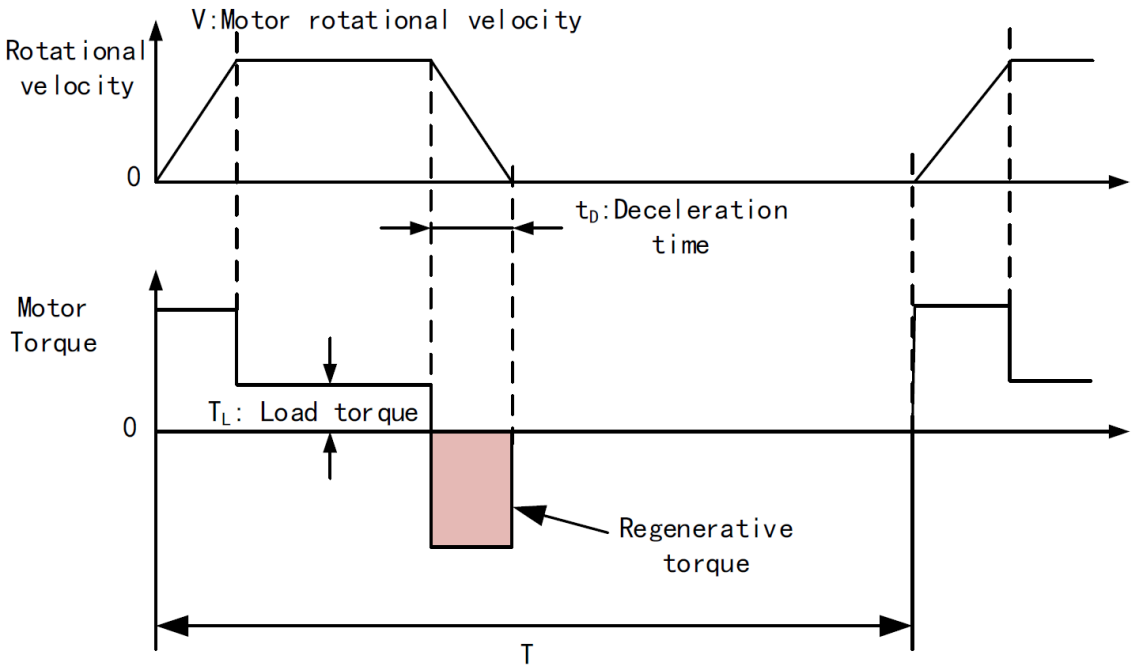


Table 2-4 Steps to calculate capacity of regenerative resistor

Steps	Calculation	Symbol	Formula
1	Servo system regenerative energy	E1	$E1=(N+1)\times J\times V^2/182$
2	Depleted energy from loss of load system during acceleration	E_L	$E_L=(\pi/60)\ V\times T_L\times tD$ *If loss is not determined, please assume $E_L=0$.*
3	Depleted energy due to motor coil resistance.	E_M	$E_M=(U^2/R)\times tD$ R= coil resistance, U = operating voltage *If R is not determined, please assume $E_M=0$.*
4	Energy stored by internal DC capacitors	Ec	Please refer to table 2-5
5	Depleted energy due to regenerative resistance	E_K	$E_K=E1-(EL+EM+EC)$, If loss is ignored, EK=E1-EC
6	Required power rating of regenerative resistor	Pr	$Pr=E_K/(0.5\times T)$

Internal capacitors capacity and rotor inertia

OSD-H Drivers	Servo motor	Rotor Inertia ($\times10^{-4}kg.m^2$)	Max. regenerative energy stored in capacitors Ec(J)
400W	OSM-060401C-2NM310-M2	0.58	13.47
750W	OSM-080751C-2NM310-M2	1.66	22.85
1000W	OSM-080102C-2NM310-M2	1.79	27.74

There are motors with low, medium and high inertia. Different motor models have different rotor inertia. Please refer to servo product catalogue for more information on rotor inertia.

Calculation examples:

Servo drive: OSD-H-*-E750N, Servo Motor: ELM2H-0750LA80. When T = 2s, rotational velocity = 3000rpm, load inertia is 5 times of motor inertia.

OSD-H Drivers	Servo motor	Rotor Inertia ($\times 10^{-4}$kg.m^2)	Max. regenerative energy stored in capacitors Ec(J)
750W	OSM-080751C-2NM310-M2	1.66	22.85

Regenerative energy produced

$$E1 = \frac{(N+1) \times J \times V^2}{182} = \frac{(5+1) \times 1.66 \times 3000^2}{182} = 49.3J$$

If E1<Ec, internal capacitors can't take in excessive regenerative energy, regenerative resistor is required.

Required regenerative resistor power rating Pr

$$Pr = \frac{(E1 - Ec)}{0.5T} = \frac{49.3 - 22.85}{0.5 \times 2} = 26.45W$$

Hence, with the internal regenerative resistor Pr = 75W, Pr<Pr, no external regenerative resistor is required.

Let's assume if the load inertia is 15 times of motor inertia, Pr = 108.6W, Pr>Pr, external regenerative resistor is required. And to consider for harsh working environment,

Pr(external)=108.6/ (1-40%) =181 W

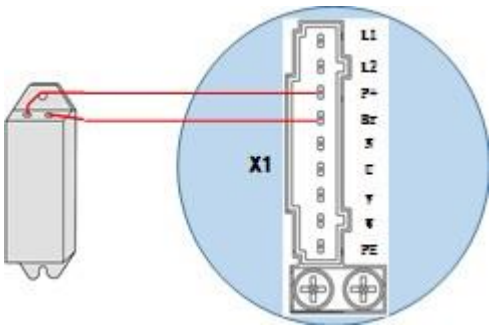
When selecting the resistance of the regenerative resistor, please be higher than the minimum value recommended in table 2-3 but lower than Rmax

Rmax = (3802-3702)/Pr=7500/108.6=69Ω

In conclusion, a regenerative resistor with resistance 40Ω - 70Ω and power rating 110W to 180W can be chosen.

Please take note that theoretical calculations of the regenerative resistance are not as accurate as calculations done under normal operation.

Connection of a regenerative resistor



2.4.3 Wire Gauge for Main Power Supply

Table 2-6 Main power supply wire gauge

Driver	Wire diameter (mm²/AWG)			
	L1 L2/R S T	P+ BR	U V W	PE

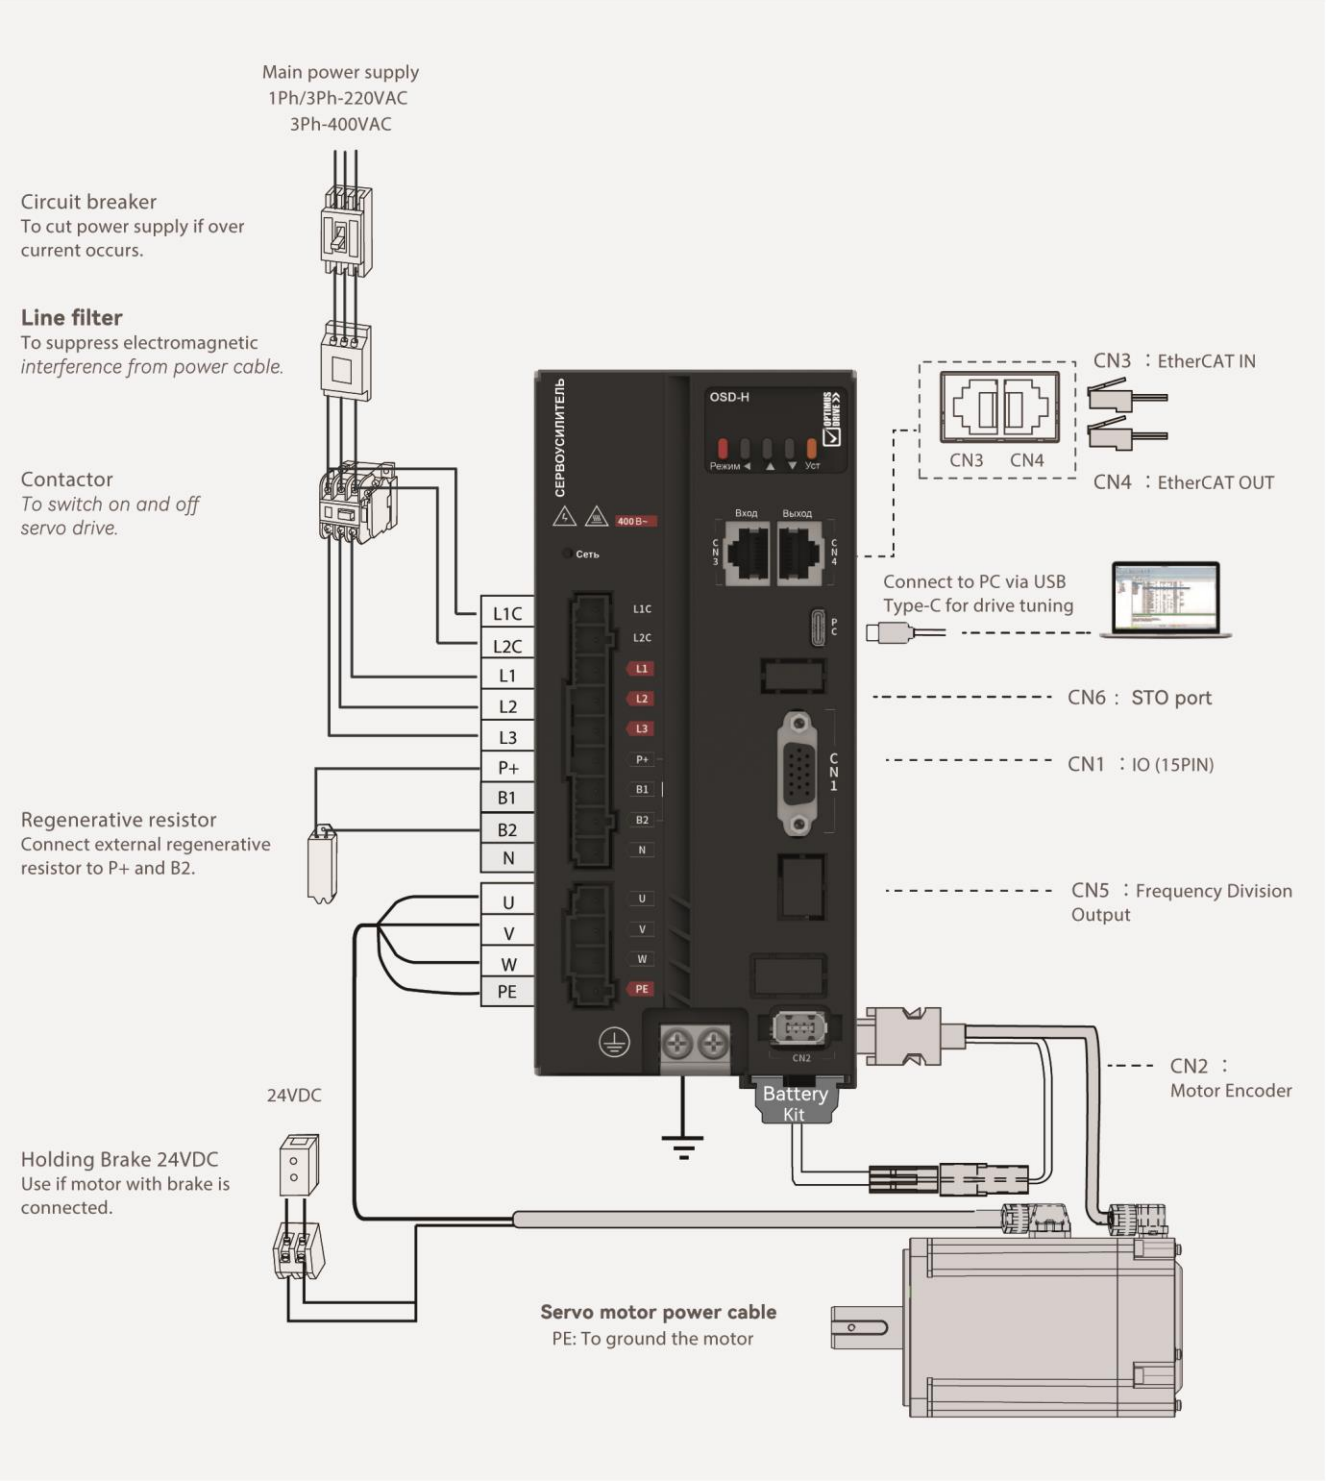
OSD-4T7D5-*	4.2/AWG11	2.6/AWG13	3.3/AWG12	3.3/AWG12

- Grounding: Grounding wire should be thicker. Ground PE terminal of servo drive and servo motor together with resistance <100 Ω.
- A 3-phase isolation transformer is recommended to lessen the risk of electrocution
- Connect a line filter to power supply to reduce electromagnetic interference.
- Please install a fuseless circuit breaker to cut off power supply in time when the driver fails.

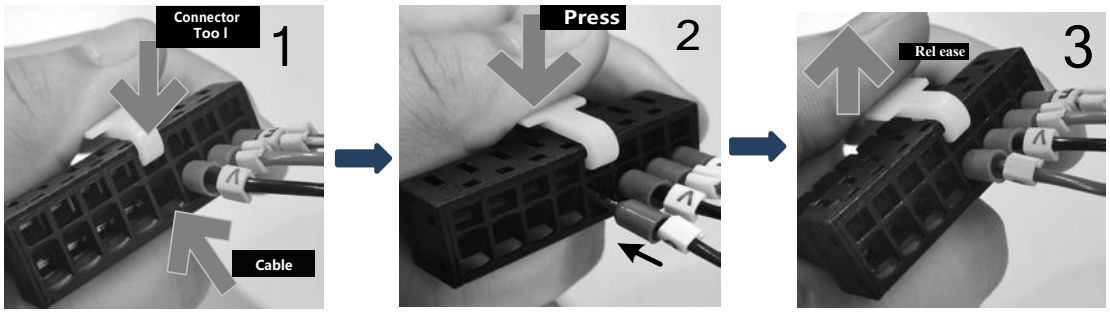
2.4.4 Wiring connections for OSD-H-*-E series servo drives



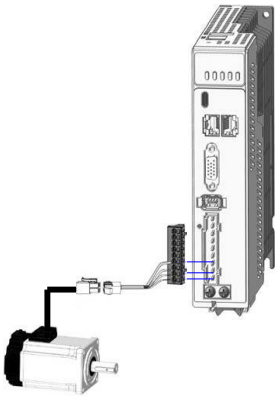
- Please use a circuit breaker for the main power supply to prevent damage to the product or machine.
- Please do not use a contactor in connection to servo motor as it may not withstand a sudden surge of operating voltage.

Please take note of the capacity when connect to a 24VDC switching power supply, especially if power supply is shared between multiple components. Insufficient supply current will cause failure in holding brake functions.

To fix wire cables into connector



2.4.5 Connecting motor power cable to servo drive



Example: Connecting a motor with electrical connectors

The power cable from the driver is labeled with U, V, W, PE. Please connect the wires accordingly to the power cable extending from the servo motor.

Motor power cable selection

Motor winding power cable

- Wire length available: 1.5m, 3m and 5m
- Connectors type available: AMP electrical connectors, aviation connectors, direct connectors (recommended)
- Please contact Optimus Drive sales team or any Optimus Drive certified local retailers for any customized needs.

Motor winding power cable

2.4.6 Holding Brake Wiring Diagram

Holding brake is activated when servo drive is not powered on to prevent axis from moving due to gravitational pull or other external forces by locking the motor in place. Usually used on axis mounted vertically to the ground so that the load would not drop under gravitational force when the driver is powered off or when alarm occurs.

➢ Mechanical noise might exist when motor with holding brake is in operation but it doesn't affect the functionality of the motor.

 When the holding brake circuit is closed (holding brake deactivated), there might be magnetic flux leakage. Please be aware to not use magnetic sensor around motor with holding brake.

 24V operating voltage for the holding brake has to be ensured to maintain the functionality of the holding brake. Please consider the voltage dropped over lengthy motor cables due to increase in cable resistance.

 It is recommended to have an isolated switching power supply for the holding brake to prevent malfunctioning of the holding brake in case of voltage drop.

2.5 CN1 I/O Signal Port

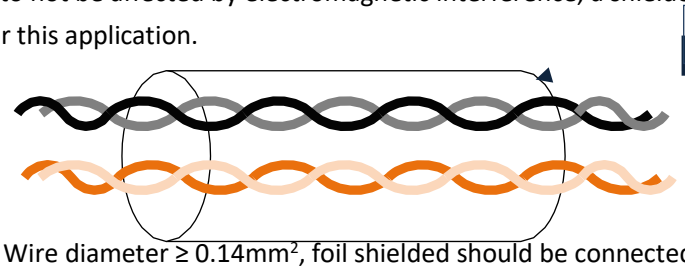
CN1 connector is a DB15 female connector.

Port	Pin	Signal	Description	Remarks
	1	DO1+	SRDY+	Servo Ready Output Signal
	6	DO1-	SRDY-	
	3	DO2+	ALM+	Alarm Output Signal
	2	DO2-	ALM-	
	5	DO3+	BRK-OFF+	Break Off Output Signal
	4	DO3-	BRK-OFF-	
	10	DI1	POT	Positive limit switch
	9	DI2	NOT	Negative limit switch
	8	DI3	HOME	Homing switch
	7	DI4	EXT 2	Touch Probe 2
	11	DI5	EXT 1	Touch Probe 1
	12	DI6	-	Up to user configuration
	13	COM+	Common DI	Common digital input terminal
	14	COM-	Internal 24V Power	Output voltage: 20~28VDC, max
	15	24V+	Supply	current output: 200mA

2.5.1 Selection of I/O signal cable

I/O signal cable

To ensure I/O signal to not be affected by electromagnetic interference, a shielded twisted pair cable is recommended for this application.



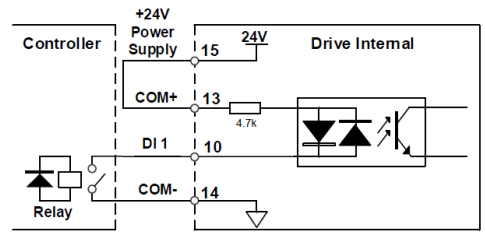
- Wire diameter ≥ 0.14mm², foil shielded should be connected to PE terminal.
- Wire length should be as short as possible, not more than 3m.
- Install a surge suppressor in feedback circuit; flyback diode inversely connected in Parallel in DC coil and capacitors connected in Parallel in AC coil.
- Recommended wire gauge: 24 - 26AWG
- I/O signal included DI, DO and relay output signal
- Please keep 30cm away from main power supply cable or motor power cable to avoid electromagnetic interference.

2.5.2 Common input circuit

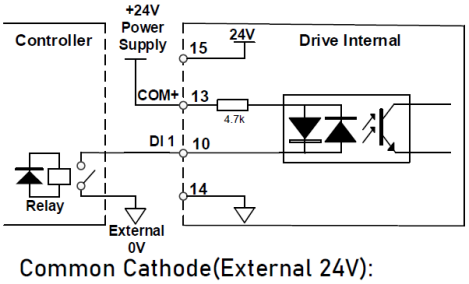
The internal circuit of common input is a bidirectional optocoupler which supports common anode and common cathode configurations. There are 2 types of outputs from master device: Relay output and Open Collector output as shown below.

①Output from master device: Relay

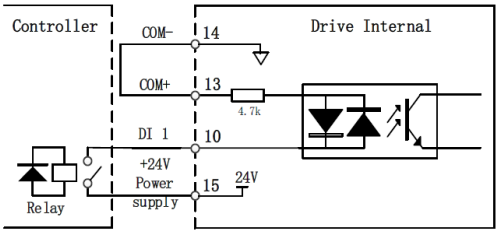
Common Anode(Internal 24V):



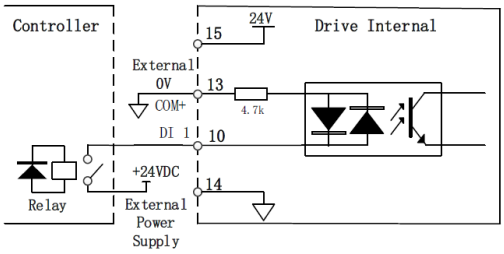
Common Cathode(Internal 24V):



Common Anode(External 24V):

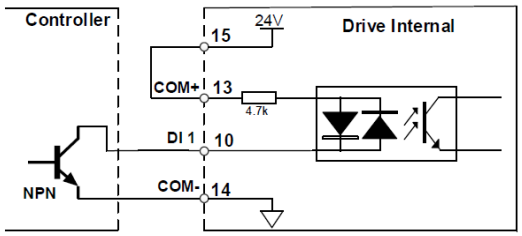


Common Cathode(External 24V):

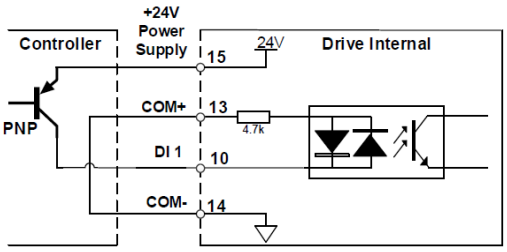


②Output from master device: Open Collector

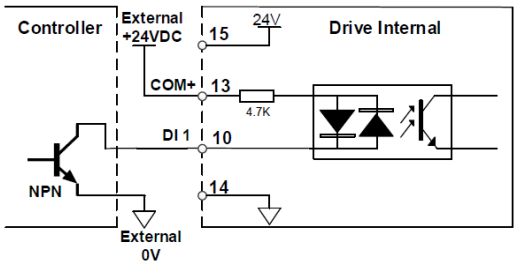
Common Anode(Internal 24V):



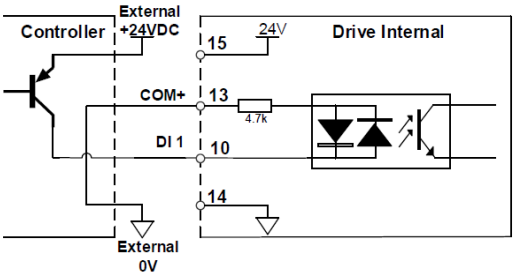
Common Cathode(Internal 24V):



Common Anode(External 24V):



Common Cathode(External 24V):

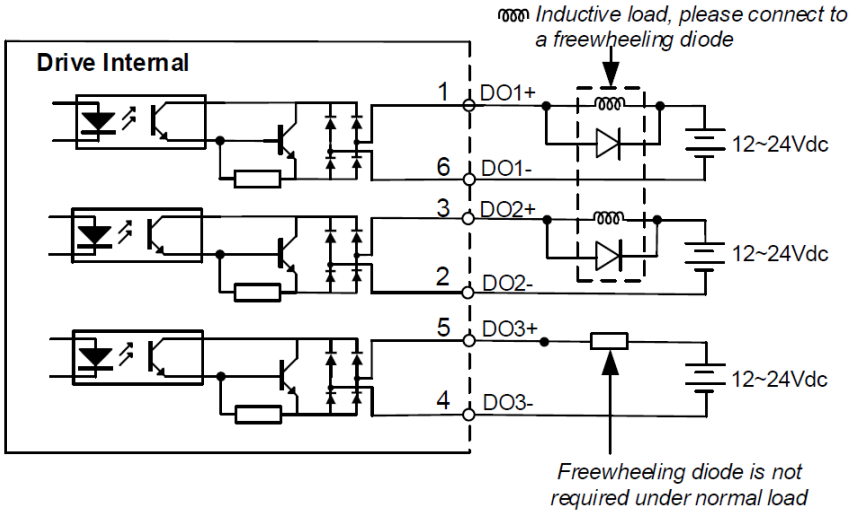


Please preparer switching power supply with output of 12-24VDC, current≥ 100mA

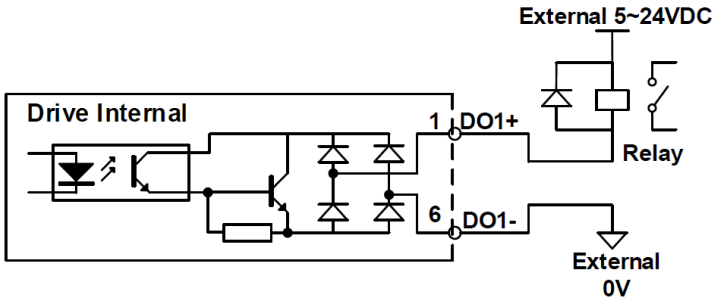
2.5.3 Common output circuit

There are 3 common outputs: DO1 ~ DO3 are double-ended, having an isolated 24v power supply.

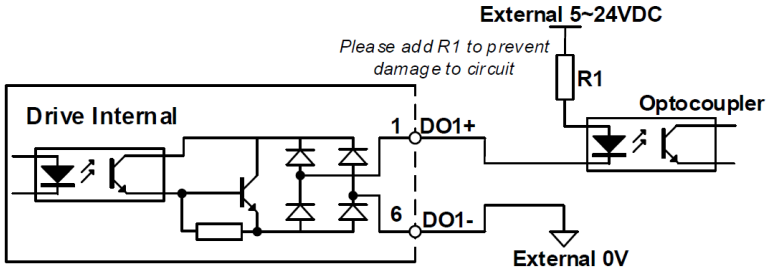
Double-ended Digital Outputs



When connected to a relay:



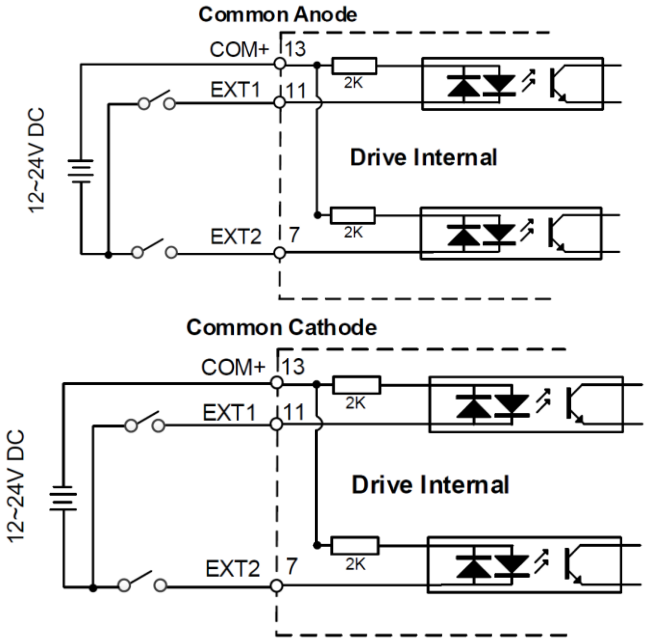
When connected to optocoupler:



- Power supply is provided by user. Please be aware that reversed power supply polarity might cause damage to the driver.
- When it is an open collector output, max current: 50mA, max supplying voltage: 25V. Please ensure the switching power supply fulfills the conditions.
- If the load is an inductive load such as a relay, please connect a flyback diode in Parallel in reverse. A wrong installation of the flyback diode might cause damage to the driver.

2.5.4 Probe input circuit

The internal circuit of probe input is a bidirectional optocoupler.



2.5.5 DI signal function configuration

Table 2-8 Default DI signal functions

CN1 Pin	Signal	Parameter	Default function	Factory default		
				Set Value	Polarity	Status
13	DI COM	-	Common Digital Input	0x0	-	-
10	DI1	PR4.00	Positive limit switch (POT)	0x1	NO	OFF
9	DI2	PR4.01	Negative limit switch (NOT)	0x2	NO	OFF
8	DI3	PR4.02	Home switch (HOME)	0x16	NO	OFF
12	DI6	PR4.05	User configurable	-	-	-

**NO: Normally Open

- When limit switch or emergency stop is used, POT, NOT and E-STOP signal will be normally close (NC) by default. Please make sure there is no safety concern if these signals need to be set to normally open (NO).

Relevant Parameter s

Motor side

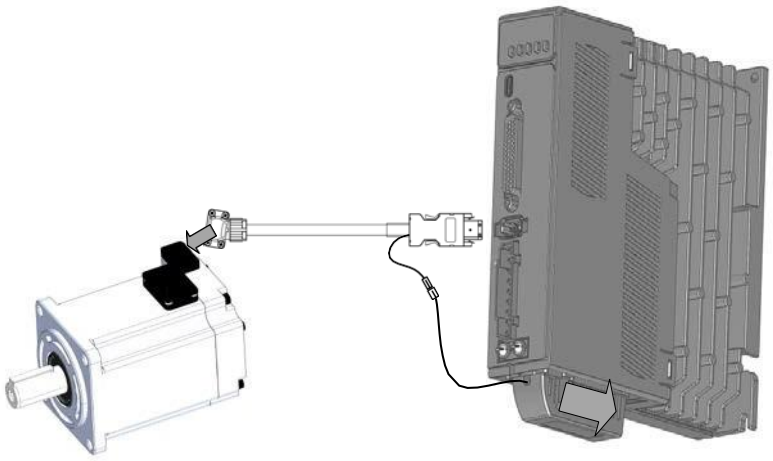
a) Please ground cable shield foil to drive to prevent servo error alarm
b) Please use a double winded shielded cable and make sure to be as short as possible.
c) Please serrate CN1 cable from power cables with a minimum gap of 30cm.

Battery kit installation

Please install the battery kit as the following diagram if our Optimus Drive direct connector motor doesn't come with an online battery kit.



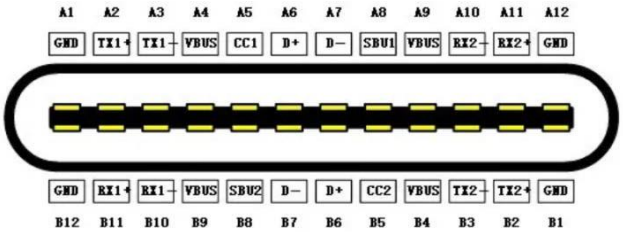
2.7 CN3/CN4 EtherCAT Communication Port

CN3 and CN4 are communication ports for EtherCAT protocol. LAN cable from master device will be connected to CN3 (IN) and CN4 (OUT) will be connected to the next slave device.

Port	Pin	Signal	Description
	1, 9	E_TX+	EtherCAT Data sending positive terminal
	2, 10	E_TX-	EtherCAT Data sending negative terminal
	3, 11	E_RX+	EtherCAT Data receiving positive terminal
	4, 12	--	--
	5, 13	--	--
	6, 14	E_RX-	EtherCAT Data receiving negative terminal
	7, 15	--	--
	8, 16	--	--
	Frame	PE	Shielded ground

2.8 USB Type-C Tuning Port

OSD-H-*-E series servo drive can be connected to PC for performance tuning, data monitoring and Parameter s modifying using a **USB Type-C data cable**. Can be done without the servo drive connecting to main power supply.



Port	Pin	Signal	Description
USB Type-C	A4, B4, A9, B9	VCC 5V	Power supply positive terminal 5V
	A12, B12, A1, B1	GND	Power supply negative terminal
	A6, B6	D+	USB data positive terminal
	A7, B7	D-	USB data negative terminal
	Frame	USB_GND	Ground through capacitors

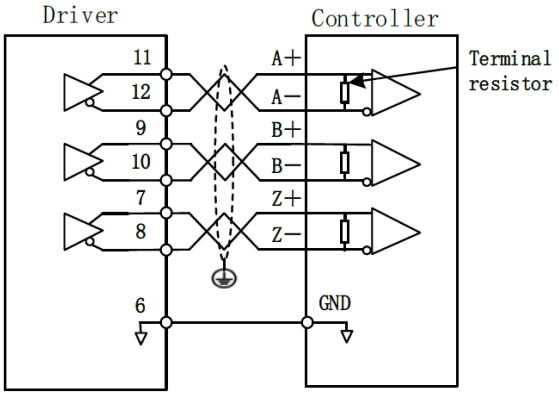
		5	OCZ	Motor encoder Z-signal OC output
		6	GND	Motor encoder Z-signal OF output reference ground
		3	/	/
		4	/	/
		1	PE	Shield grounding
		2	/	/

**Please use stranded shielded cable ≥ 0.14mm² with shield foil grounded to PE terminal.*

***Keep it shorter than 3 meters and away from any power cables.*

Encoder signal after frequency divider circuit is output as differential signal. It provides feedback signal for controller using position control mode. Please use differential or optocoupler receiving circuit for controller. A terminal

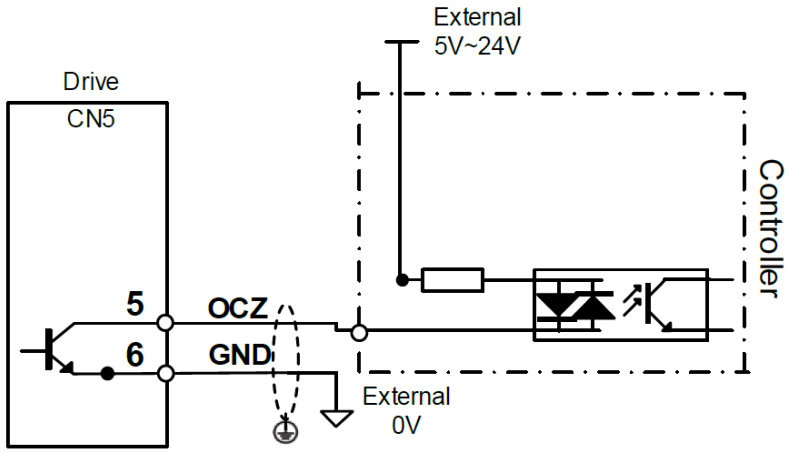
Differential Connection:



resistor needs to be installed in the differential signal input circuit. Resistance of the terminal resistor is as accordance to actual use.

If controller input circuit is not an optocoupler input circuit but a differential receiving circuit, please connect CN5 pin 6 (OC reference ground) to GND of controller differential receiving circuit.

Encoder Z-phase frequency divider output:



2.10 CN6 Safe Torque Off (STO) Port

Port	Pin	Signal	Description	Remarks
	1	0V	Reference ground	Connect to SF1 and SF2 when not in use. Do not use to supply power.
	2	24V	24V power supply	
	3	SF1+	Control signal 1positive input	When SF1 = OFF or SF2 = OFF, STO is enabled.
	4	SF1-	Control signal 1negative input	

Introduction to Safe Torque Off (STO)

Function: Cut off motor current supply physically (through mechanical means)

STO module (CN6 connector) consists of 2 input channels. It cuts off the motor current supply by blocking of PWM control signal from the power module. When the motor current is cut off, the motor will still move under inertia and stops gradually.

The STO function is set up ready to be used by factory default. Please remove STO connector if it is not needed.

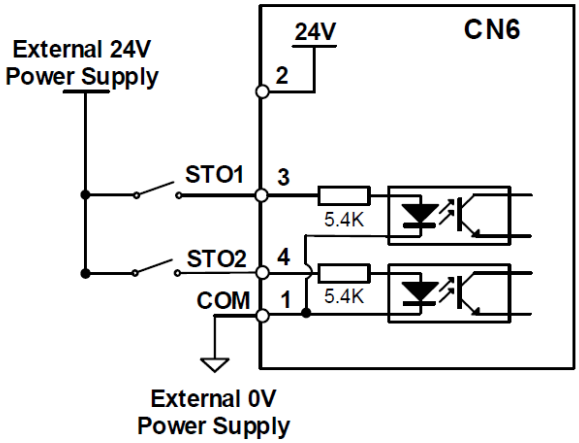
STO functional principle

STO module cuts off the motor current supply and stops motor gradually by blocking of PWM control signal from the power module through 2 isolated circuits. When a STO error occurs, the actual status of STO can be determined by the EDM status feedback.

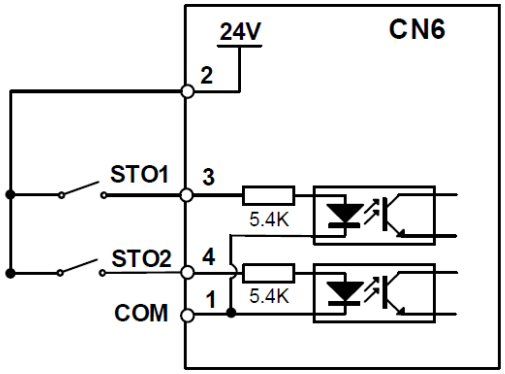
ST01 Input Status	ST02 Input Status	PWM control signal	Alarm code
ON	ON	Normal	-
ON	OFF	Blocked	Er 1c2
OFF	ON	Blocked	Er 1c1
OFF	OFF	Blocked	Er 1c0

STO wiring diagram

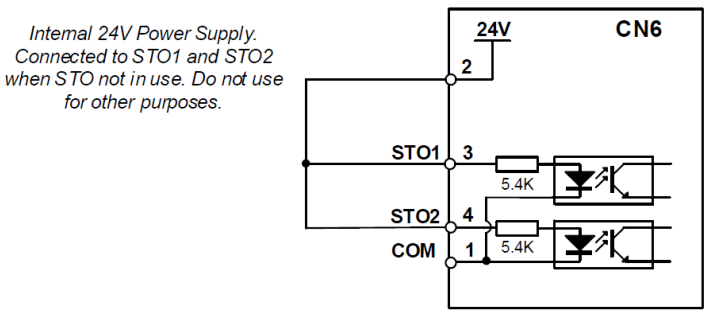
STO in use (External 24V)



STO in use (Internal 24V)



STO not in use (STO1 & STO2 shorted together)



Please take precautions when enabling STO functions as servo drive will lose control over the motion of the motor. Motor might drop under gravitational pull (vertically mounted load) or moved when external forces are applied to it. Alternatively, motor with holding brake can be chosen.

- *STO is not meant to cut off the power supply of the servo drivers and motors completely. Please power off and wait for a few minutes before starting maintenance work.*
- *It is recommended to use an isolated power supply for STO signal input as any current leakage might cause STO malfunction.*

2.11 Measures against electromagnetic interference

To reduce interference, please take the following measures:

- I/O signal cable > 3m; Encoder cable > 20m
- Use cable with larger diameter for grounding

①Grounding resistance > 100Ω

②When there are multiple drivers connected in Parallel, PE terminal of the main power supply and ground terminal of servo drives must be connected to copper ground bar in the electrical cabinet and the copper ground bar needs to be connected to the metal frame of the cabinet.

- Please install a line filter on main power supply cable to prevent interference from radio frequency.
- In order to prevent malfunctions caused by electromagnetic interference, please take following measures:

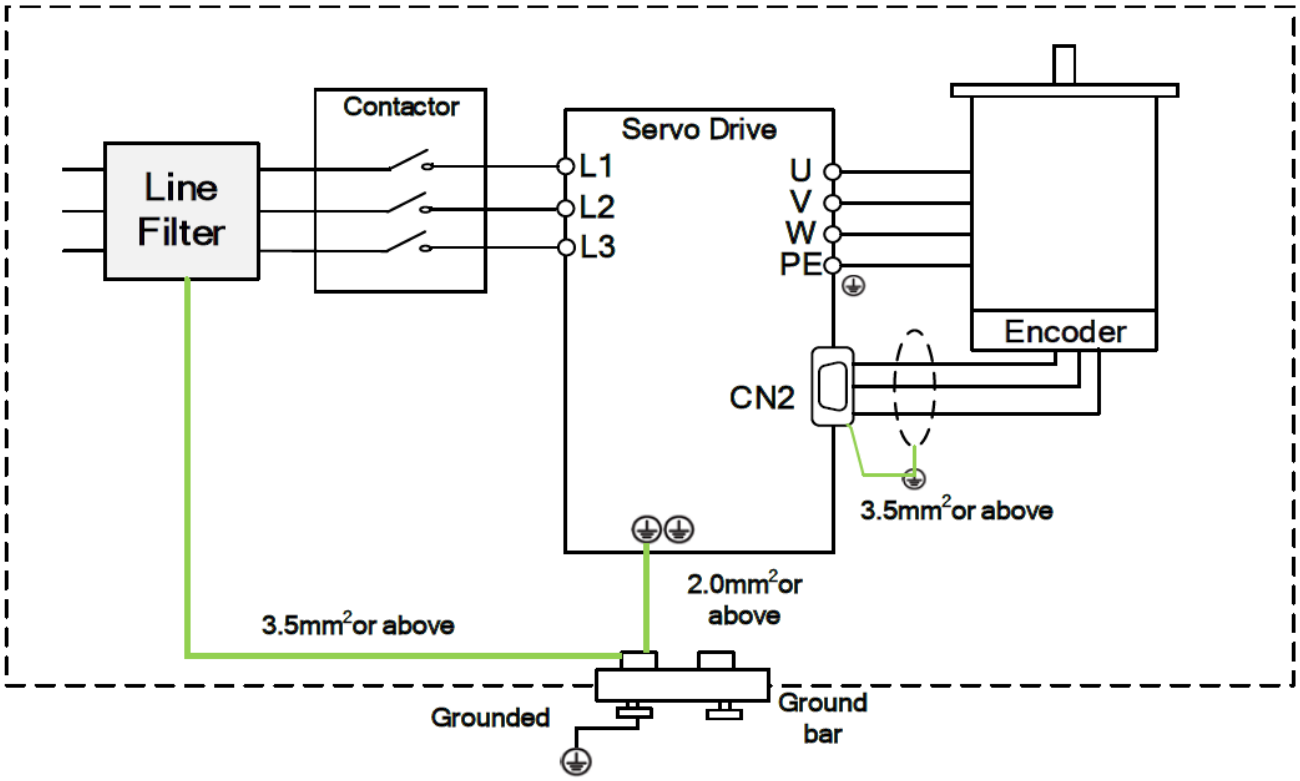
①Install master device and line filter close to the servo drive

②Install surge suppressor for relay and contactor

③ Please separate signal/encoder cable from power cable with a space of at least 30cm

④Install a line filter for the main power supply if a device with high frequency generation such as a welding machine exists nearby

2.11.1 Grounding connection and other anti-interference wiring connections

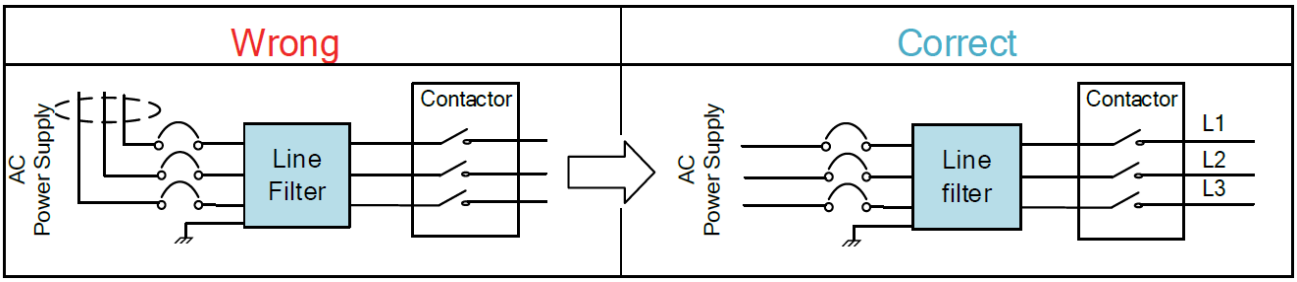


- Servo motor frame should be grounded. Please connect the PE terminal of servo motor and servo drive and ground them together to reduce interference.
- Ground both ends of the foil shield of encoder cable.

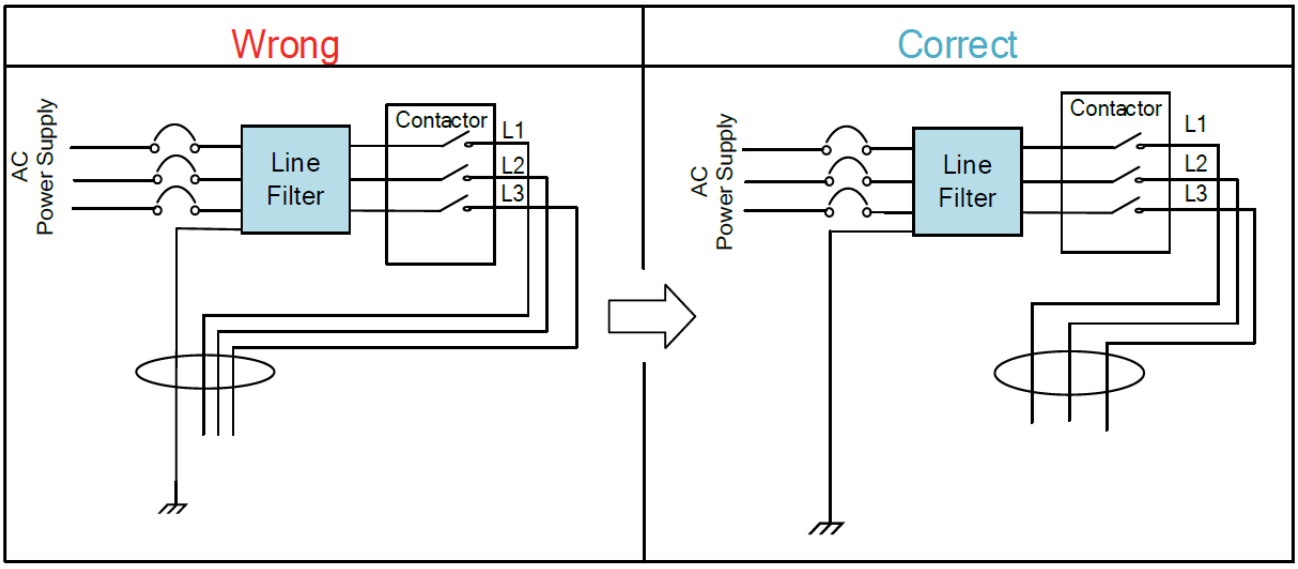
2.11.2 Using line filter

To reduce interference from main power supply cable and to prevent from affecting other sensitive components around the servo drive, please choose a line filter based on actual supply current. Please do be aware of the following mistake when installing a line filter.

Do not band the main power supply cable together.



Separate the ground wire from the line filter and the main power supply cable.



Ground wires inside an electrical cabinet

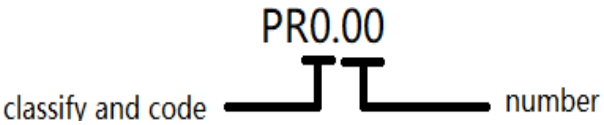
3.2 Parameter Function

Panel Display as follows:



Parameter valid under following modes:

CSP: Cyclic synchronous position mode

CSV: Cyclic synchronous velocity mode

CST: Cyclic synchronous torque mode

HM: Homing mode

PP: Profile position mode

PV: Profile velocity mode

PT: Profile torque mode

F: All modes

3.2.1 【Class 0】Basic Settings

PR0.00	Label	Model-following bandwidth	Mode	F		
	Range	0~5000	Default	1	Unit	0.1Hz
	Activation	Immediate			Index	2000h

Model-following bandwidth, also known as model-following control (MFC), is used to control the position loop to improve the responsiveness to commands, speed up positioning time and reduce following error. The effect is obvious especially in low and medium mechanical stiffness. Use mainly for MFC or ZTC tuning.

Value	Description
0	Disable the function.
1	Enable the function to set bandwidth automatically, recommended for most applications. PR0.00=PR1.01
2	Reserved
3-9	Invalid

PR0.00>9: Model-following bandwidth value set by PR0.00. 10<Pr0.00<5000: Specifies the bandwidth.

**Recommended settings for belt application: 30<PR0.00<100.*

PR0.01	Label	Control Mode Settings	Mode	F		
	Range	0~9	Default	9	Unit	-
	Activation	After restart			Index	2001h

Set value to use following control modes：

Value	Content	Details
0-8	Reserved	Reserved
9	EtherCAT mode	PP/PV/PT/HM/CSP/CSV/CST

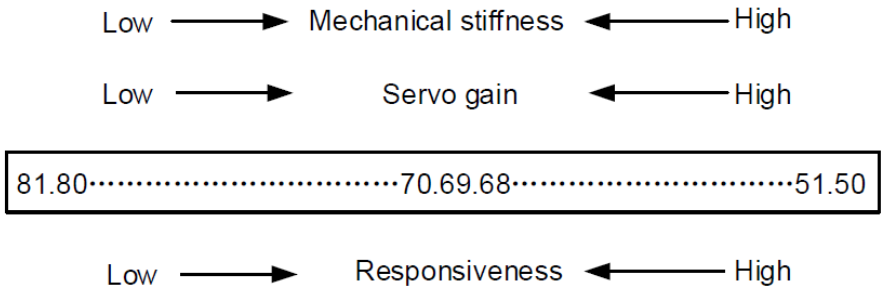
PR0.02	Label	Real time Auto Gain Adjusting	Mode	F		
	Range	0x0~0xFFF	Default	0x001	Unit	—
	Activation	Immediate			Index	2002 h
Set up the mode of the real time auto gain adjusting.						

Data bits	Category	Settings	Application
0x00_	Motion setting mode	Used to set motion setting mode, which can be selected according to the motion characteristics or setting requirements. Generally, it is recommended to select mode 1 with good generality when there is no special requirement, mode 2 when rapid positioning is needed If mode 1 and mode 2 cannot meet the requirements, please choose mode 0.	
		0: Manual	PR0.03 invalid. Gain value must be adjusted manually and accordingly.
		1: Standard	PR0.03 valid. Quick gain adjusting can be achieved by changing PR0.03 stiffness value. Gain switching is not used in this mode, suitable for applications with requirements for stability.
		2: Positioning	PR0.03 valid. Quick gain adjusting can be achieved by changing PR0.03 stiffness value. This mode is suitable for applications requiring quick positioning. Not recommended for load mounted vertical to ground, or please compensate for the load using PR6.07
0x0_0	Load type setting	Used to select the load type, choose according to load-inertia ratio and mechanical structure.	
		0: Rigid structure	This mode prioritizes system responsiveness. Use this mode when there is a relatively rigid structure with low load inertia. Typical application including directly connected high-precision gearbox, lead screw, gears, etc.
		1: High inertia	For applications with higher load inertia (10 times or above), gain settings take into account both machine stability and responsiveness. Not recommended to set stiffness above 15 for high load inertia.
		2: Flexible structure	This mode prioritizes system stability. Use this mode when there is low rigidity structure with high load inertia. Typical applications included belts and chains.
0x_00	*Reserved*		

The setting type combination is a hexadecimal standard, as follows:	
0X000	Rigid structure + Manual
0X001	Rigid structure +Standard
0X002	Rigid structure +Positioning
0X010	High inertia + Manual
0X011	High inertia + Standard
0X012	High inertia + Positioning
0X020	Flexible structure + Manual
0X021	Flexible structure +Standard
0X022	Flexible structure +Positioning

PR0.03	Label	Real time auto stiffness adjusting	Mode	F		
	Range	50 ~ 81	Default	70	Unit	—
	Activation	Immediate			Index	2003h

Valid when PR0.03 = 1,2



- Lower values ensure better system responsiveness and mechanical stiffness but machine vibration might occur, please set accordingly. Please stop the motor before doing any changes to the stiffness settings.
- When PR0.02 = 0x010, please set stiffness level to around 65.

PR0.04	Label	Inertia ratio	Mode	F		
	Range	0~20000	Default	250	Unit	%
	Activation	Immediate			Index	2004h

PR0.04= (load inertia/motor rotational inertia) ×100%

Set inertia ratio according to actual load inertia. When both are uniform, actual motor velocity loop responsiveness and gain settings will be consistent. If inertia ratio is greater than actual value, velocity loop gain settings will be higher and vice versa.

For motor with high inertia, PR0.04 can be left unfilled but optimal setting of PR0.04 could improve system performance.

PR0.06	Label	Command polarity inversion	Mode	F		
	Range	0 ~ 1	Default	0	Unit	—
	Activation	After restart			Index	2006h

Used to change the rotational direction of the motor

Set value	Details
0	Polarity of the command is not inversed. The direction of rotation is consistent with the polarity of command.
1	Polarity of command is inversed. The direction of rotation is opposite to the polarity of command.

Note: Rotational direction of the motor is recommended to be set through object dictionary 607E. However, PR0.06 has higher priority than object dictionary 607E. 607E only takes effect when PR0.06 = 0.

PR0.07	Label	Probe signal polarity settings	Mode	F		
	Range	0 ~ 3	Default	3	Unit	—
	Activation	After restart			Index	2007h

Probe signal polarity settings take effect when PR0.01 = 9

0	Probe 1 & 2 polarity inversion
1	Probe 2 polarity inversion
2	Probe 1 polarity inversion
3	No polarity inversion for probe 1 & 2

If PR0.01 ≠ 9, PR0.07 = Command pulse input mode settings.

Command pulse input

Command Polarity inversion (PR0.06)	Command pulse input mode settings (PR0.07)	Command Pulse Mode	Positive signal	Negative signal
【0】	0 *or* 2	90°phase difference 2 phase pulse （Phase A+ Phase B）			1	CW pulse sequence ＋ CCW pulse sequence		
	【3】	Pulse sequence ＋ Directional symbol		
1	0 *or* 2	90°phase difference 2 phase pulse （Phase A Phase B）		
	1	CW pulse sequence ＋ CCW pulse sequence		
	□3	Pulse sequence ＋ Directional symbol		

Command pulse input signal max. frequency and min. duration needed

Command pulse input interface		Max. Frequency	Min. duration needed (μs)					
			t1	t2	t3	t4	t5	t6
Pulse sequence interface	Differential	500 kHz	2	1	1	1	1	1
	Open collector	200 kHz	5	2.5	2.5	2.5	2.5	2.5

Please set >0.1μs for the duration between rising and falling edge of command pulse input signal.

1 revolution with 2500 pulses 2-phase pulse input when PR0.07=0 or 2, PR0.08 = 10000; 1 revolution with 10000 pulses 1 phase pulse input when PR0.07=1 or 3, PR0.08 = 10000

PR0.08	**Label**	Command pulse count per revolution	**Mode**	**F**		
	Range	0~8388608	**Default**	0	**Unit**	P-
	Activation	After restart			**Index**	2008h

Pulses per revolution can be set using object dictionary 608F, 6091, 6092. However, PR0.08 has higher priority.

PR0.09	**Label**	1st command frequency divider/multiplier numerator	**Mode**	**F**		
	Range	1~2147483647	**Default**	1	**Unit**	P-
	Activation	After restart			**Index**	2009h

This Parameter correspond s to object dictionary 6091-01. Modifying this Parameter is the same as changing object dictionary 6091-01 value. Valid when PR0.08 = 0.

PR0.10	**Label**	1st command frequency divider/multiplier denominator	**Mode**	**F**		
	Range	1~2147483647	**Default**	1	**Unit**	P-
	Activation	After restart			**Index**	2010h

This Parameter correspond s to object dictionary 6091-02. Modifying this Parameter is the same as changing object dictionary 6091-02 value. Valid when PR0.08 = 0.

PR0.11	**Label**	Encoder pulse output per revolution	**Mode**	**F**		
	Range	0~65535	**Default**	2500	**Unit**	P/r
	Activation	After restart			**Index**	2011

Including rising and falling edge of encoder phase A and B, encoder actual differential output pulse count = PR0.011 x 4

Please make sure: Motor rotational speed x PR0.11 x 4≤1MHz. If exceeds, alarm Er280 might occur.

PR0.12	Label	Pulse output logic inversion	Mode	F		
	Range	0~1	Default	0	Unit	-
	Activation	After restart			Index	2012

To set phase B logic and output source from encoder pulse output. To inverse B-Phase pulse logic and change the phase relation between Phase A and Phase B

Pulse output logic inversion

PR0.12	Phase B logic	CW direction	CCW direction
[0]	Not inverted		[1]	Inverted		
PR0.13	Label	1st Torque Limit	Mode	F		
	Range	0~500	Default	300	Unit	%
	Activation	Immediate			Index	2013h

1st torque limit is set according to ratio percentage of motor rated current. Do not exceed max driver output current.
Actual torque limit is the smaller value of PR0.13 and object dictionary 6072

PR0.14	Label	Excessive Position Deviation Settings	Mode	PP	HM	CSP
	Range	0~500	Default	30	Unit	0.1rev
	Activation	Immediate			Index	2014h

Please set threshold value for position deviation accordingly. Default factory setting = 30, Er180 will be triggered if positive deviation is in excess of 3 revolutions.

PR0.15	Label	Absolute Encoder settings	Mode	PP	HM	CSP
	Range	0~32767	Default	0	Unit	-
	Activation	Immediate			Index	2015h

0: Incremental mode:
Used as an incremental encoder. Doesn't retain position data on power off. Unlimited travel distance.
1: Multiturn linear mode:
Used as a multiturn absolute encoder. Retrain position data on power off. For applications with fixed travel distance and no multiturn data overflow.
2: Multiturn rotary mode:
Used as a multiturn absolute encoder. Retrain position data on power off. Actual data feedback in between 0-(PR6.63). Unlimited travel distance.
3: Single turn absolute mode:
Used when travel distance is within 1 revolution of the encoder. Data overflow will trigger alarm.
5: Clear multiturn alarm and activate multiturn absolute function. Will switch to multiturn mode once alarm cleared, if remains at 5 after 3s, please solve according to Er153.
9: Clear multiturn position, reset multiturn alarm and activate multiturn absolute function. Will switch to multiturn mode once alarm cleared, if remains at 9 after 3s, please solve according to Er153. ***Please disable axis before setting to 9 and home the axis before using.***

PR0.16	Label	Regenerative resistance	Mode	F		
	Range	25~500	Default	100	Unit	Ohm
	Activation	Immediate			Index	2016h
To set resistance value of regenerative resistor						

PR0.17	Label	Regenerative resistor power rating	Mode	F		
	Range	20~5000	Default	50	Unit	W
	Activation	Immediate			Index	2017h

To set power rating of regenerative resistor

Drive	Resistance(Ω)	Power Rating(W)
OSD-H-2SD40	100	50
OSD-H-2SD75	50	75
OSD-H-2S1D0	50	75
OSD-H-2S1D5	50	80
OSD-H-2S2D0	50	80

PR0.16 and PR0.17 determines the threshold value of Er 120. Please set accordingly or it might trigger false alarm or damage to servo driver.

Note: If external regenerative resistor is used, please set according to its labeled power rating.

PR0.19	Label	Friction compensation setting	Mode	F		
	Range	0~1000	Default	0	Unit	-
	Activation	Immediate			Index	2022h

Friction compensation setting = 0, default = 1;

Friction compensation setting = x, indicating x+1/10000 of friction compensation runway;

PR0.23	Label	EtherCAT slave ID	Mode	F		
	Range	0~32767	Default	2	Unit	-
	Activation	After restart			Index	2023h

Set ID number of the slave station under EtherCAT mode

PR0.24	Label	Source of slave ID	Mode	F		
	Range	0~1	Default	1	Unit	-
	Activation	After restart			Index	2024h

0: Master device automatically assigns a slave address. 1： The slave ID = PR0.23

PR0.25	Label	Synchronous compensation time 1	Mode	CSP		
	Range	1~100	Default	10	Unit	0.1us
	Activation	After restart			Index	2025h

Synchronous dithering compensation range. Used for master device with poor synchronization.

PR0.26	Label	Synchronous compensation time 2	Mode	CSP		
	Range	1~2000	Default	50	Unit	0.1us
	Activation	After restart			Index	2026h
Synchronous dithering compensation range. Used for master device with poor synchronization.						

PR0.27	Label	Synchronization mode command delay cycle counts	Mode	CSP		
	Range	1~50	Default	0	Unit	-
	Activation	After restart			Index	2027h
Driver delays N position loop cycle counts to receive position command from master device. To solve motor jitter caused by master device with poor synchronization.						

PR0.28	Label	CSP mode safe self-running position setting	Mode	CSP		
	Range	0~10000	Default	10	Unit	-
	Activation	Immediate			Index	2028h
Synchronous dithering compensation range. Used for master device with poor synchronization.						

3.2.2 【Class 1】Gain Adjustments

PR1.00	Label	1st position loop gain	Mode	PP	HM	CSP
	Range	0~30000	Default	320	Unit	0.1/s
	Activation	Immediate			Index	2100h
Higher position loop gain value improves the responsiveness of the servo driver and lessens the positioning time. Position loop gain value shouldn't exceed responsiveness of the mechanical system and take in consideration velocity loop gain, if not it might cause vibration, mechanical noise and overtravel. As velocity loop gain is based on position loop gain, please set both values accordingly. Recommended range: 1.2≤PR1.00/PR1.01≤1.8						

PR1.01	Label	1st velocity loop gain	Mode	F		
	Range	1~32767	Default	180	Unit	0.1Hz
	Activation	Immediate			Index	2101h
To determine the responsiveness of the velocity loop. If inertia ratio of PR0.04 is uniform with actual inertia ratio, velocity loop responsiveness = PR1.01. To increase position loop gain and improve responsiveness of the whole system, velocity loop gain must be set at higher value. Please notice that if the velocity loop gain is too high, it might cause vibration.						

PR1.02	Label	1st Integral Time Constant of Velocity Loop	Mode	F		
	Range	1~10000	Default	310	Unit	0.1ms
	Activation	Immediate			Index	2102h

If auto gain adjusting function is not enabled, PR1.02 is activated.

The lower the set value, the closer the lag error at stop to 0 but might cause vibration. If the value set is overly large, overshoot, delay of positioning time duration and lowered responsiveness might occur.

Set 10000 to deactivate PR1.02.

Recommended range: 50000≤PR1.01xPR1.02≤150000

For example: Velocity loop gain PR1.01=500(0.1Hz), which is 50Hz. Integral time constant of velocity loop should be 100(0.1ms)≤PR1.02≤300(0.1ms)

PR1.03	Label	1st velocity detection filter	Mode	F		
	Range	1~10000	Default	15	Unit	-
	Activation	Immediate			Index	2103h

This filter is a low Pass filter. It blocks high frequencies which cause system instability from velocity feedback data. The higher the set value, lower frequencies will be blocked and velocity responsiveness will also be lowered. PR1.03 needs to match velocity loop gain.

Please refer to the following table.

Value	Velocity Detection Filter Cut-off Frequency(Hz)	Value	Velocity Detection Filter Cut-off Frequency (Hz)
0	2500	16	750
1	2250	17	700
2	2100	18	650
3	2000	19	600
4	1800	20	550
5	1600	21	500
6	1500	22	450
7	1400	23	400
8	1300	24	350
9	1200	25	300
10	1100	26	250
11	1000	27	200
12	950	28	175
13	900	29	150
14	850	30	125
【15】	800	31	100

PR1.04	Label	1st Torque Filter Time Constant	Mode	F		
	Range	0~2500	Default	126	Unit	0.01ms
	Activation	Immediate			Index	2104h

To set torque command low-Pass filter, add a filter delay time constant to torque command and filter out the high frequencies in the command. Often used to reduce or eliminate some noise or vibration during motor operation, but it will reduce the responsiveness of current loop, resulting in undermining velocity loop and position loop control. PR1.04 needs to match velocity loop gain.

Recommended range: 1,000,000/(2π×PR1.04) ≥PR1.01×4

For example: Velocity loop gain PR1.01=180(0.1Hz) which is 18Hz. Time constant of torque filter should be PR1.01≤221(0.01ms)

If mechanical vibration is due to servo driver, adjusting PR1.04 might eliminate the vibration. The smaller the value, the better the responsiveness but also subjected to machine conditions. If the value is too large, it might lower the responsiveness of current loop.

With higher PR1.01 value settings and no resonance, reduce PR1.04 value;

With lower PR1.01 value settings, increase PR1.04 value to lower motor noise.

PR1.05	**Label**	2nd Position Loop Gain	**Mode**	**PP**	**HM**	**CSP**	
	Range	0~30000	**Default**	380	**Unit**	0.1/s	
	Activation	Immediate			**Index**	2105h	
PR1.06	**Label**	2nd velocity loop gain	**Mode**	**F**			
	Range	1~32767	**Default**	180	**Unit**	0.1Hz	
	Activation	Immediate			**Index**	2106h	
PR1.07	**Label**	2nd Integral Time Constant of Velocity Loop	**Mode**	**F**			
	Range	1~10000	**Default**	10000	**Unit**	0.1ms	
	Activation	Immediate			**Index**	2107h	
PR1.08	**Label**	2nd velocity detection filter	**Mode**	**F**			
	Range	1~31	**Default**	15	**Unit**	-	
	Activation	Immediate			**Index**	2108h	
PR1.09	**Label**	2nd Torque Filter Time Constant	**Mode**	**F**			
	Range	0~2500	**Default**	126	**Unit**	0.01ms	
	Activation	Immediate			**Index**	2109h	

Position loop, velocity loop, velocity detection filter, torque command filter each have 2 Pairs of gain or time constant (1st and 2nd)

PR1.10	**Label**	Velocity feed forward gain	**Mode**	**PP**	**HM**	**CSP**
	Range	0~1000	**Default**	300	**Unit**	0.10%
	Activation	Immediate			**Index**	2110h

Used for decreasing following error caused by low responsiveness of velocity loop. Might cause overshoot or increase in noise if set value is too high.

PR1.11	**Label**	Velocity feed forward filter time constant	**Mode**	**PP**	**HM**	**CSP**
	Range	0~6400	**Default**	50	**Unit**	0.01ms
	Activation	Immediate			**Index**	2111h

Set velocity feed forward low Pass filter to eliminate high or abnormal frequencies in velocity feed forward command. Often used when position command with low resolution or high electronic gear ration to smoothen velocity feed forward.

Position deviation under constant velocity can be lowered with higher velocity feed forward gain. Please to refer to the equation below.

Position deviation [Unit]= $\frac{Set\ velocity[\frac{Uint}{s}]}{Position\ loop\ gain[Hz]} x \frac{100 - Velocity\ feed\ foward\ gain[\%]}{100}$

PR1.12	**Label**	Torque feed forward gain	**Mode**	**PP**	**PV**	**HM**	**CSP**	**CSV**	
	Range	0~1000	**Default**	0		**Unit**	0.1%		
	Activation	Immediate				**Index**	2112h		

Before using torque feed forward, please set correct inertia ratio PR0.04. By increasing torque feed forward gain, position deviation on constant acceleration/deceleration can be reduced to close to 0. Under ideal condition and trapezoidal speed profile, position deviation of the whole motion can be reduced to close to 0. In reality, perturbation torque will always exist, hence position deviation can never be 0.

PR1.13	Label	Torque feed forward filter time constant	Mode	PP	PV	HM	CSP	CSV
	Range	0~6400	Default	0		Unit	0.01ms	
	Activation	Immediate				Index	2113h	

Low Pass filter to eliminate abnormal or high frequencies in torque feed forward command. Usually used when encoder has lower resolution or precision.

Noise reduces if torque feed forward filter time constant is set higher but position deviation will increase at acceleration varied points.

PR1.15	Label	Position control gain switching mode	Mode	F		
	Range	0~11	Default	0	Unit	-
	Activation	Immediate			Index	2115h

Set Value	Condition	Gain switching condition
0	1st gain fixed	Fixed on using 1st gain (PR1.00-PR1.04)
1	2nd gain fixed	Fixed on using 2nd gain (PR1.05-PR1.09)
2	Reserved	
3	High set torque	Switch to 2nd gain when set torque command absolute value larger than (level + hysteresis) [%] Switch to 1st gain when set torque command absolute value smaller than (level + hysteresis) [%] 4	Reserved	Reserved
5	High set velocity	Valid for position and velocity control. Switch to 2nd gain when set velocity command absolute value larger than (level + hysteresis) [r/min]  Switch to 1st gain when set velocity command absolute value smaller than (level-hysteresis) [r/min]

6	Large position deviation	Valid for position control. Switch to 2nd gain when position deviation absolute value larger than (level + hysteresis) [pulse] Switch to 1st gain when position deviation absolute value smaller than (level-hysteresis) [pulse] 7	Pending position command	Valid for position control. Switch to 2nd gain if position command ≠ 0 Switch to 1st gain if position command remains = 0 throughout the duration of delay time. 8	Not yet in position	Valid for position control. Switch to 2nd gain if position command is not completed. Switch to 1st gain if position command remains uncompleted throughout the duration of delay time. 9	High actual velocity	Valid for position control.  Switch to 2nd gain when actual velocity absolute value larger than (level + hysteresis) [r/min] Switch to 1st gain when actual velocity absolute value remains smaller throughout the duration of delay time than (level-hysteresis) [r/min]

10	Pending position command +actual velocity	Valid for position control. Switch to 2nd gain if position command ≠ 0 Switch to 1st gain if positional command = 0 throughout the duration of delay time and absolute value of actual velocity remains smaller than (level - hysteresis) (r/min) 
For position control mode, set PR1.15=3,5,6,9,10; For velocity control mode, set PR1.15=3,5,9;

*** Above 'level' and 'hysteresis' are in correspondence to PR1.17 Position control gain switching level and PR1.18 Hysteresis at position control switching.*

PR1.17	**Label**	Position control gain switching level	**Mode**	**F**		
	Range	0~20000	**Default**	50	**Unit**	*As set*
	Activation	Immediate			**Index**	2117h

Set threshold value for gain switching to occur. Unit is mode dependent.

Switching condition	Unit
Position	Encoder pulse count
Velocity	RPM
Torque	%

Please set level ≥ hysteresis

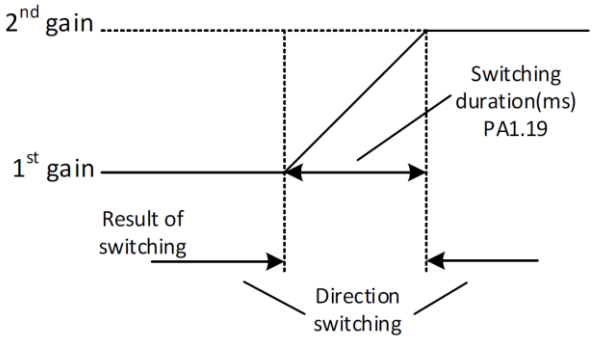
PR1.18	**Label**	Hysteresis at position control switching	**Mode**	**F**		
	Range	0~20000	**Default**	33	**Unit**	*As PR1.17*
	Activation	Immediate			**Index**	2118h

To eliminate the instability of gain switching. Used in combination with PR1.17 If level< hysteresis, drive will set internally hysteresis = level.

PR1.19	Label	Position gain switching time	Mode	F		
	Range	0~10000	Default	33	Unit	0.1ms
	Activation	Immediate			Index	2119h

During position control, if 1st and 2nd gain difference is too large, to ease torque changes and vibration due to rapid changes in position loop gain, set suitable PR1.19 value

For example: 1st (PR1.00) <-> 2nd (PR1.05)



3.2.3 【Class 2】Vibration Suppression

PR2.00	Label	Adaptive filtering mode settings	Mode	F		
	Range	0~4	Default	0	Unit	-
	Activation	Immediate			Index	2200h

Set value	Description	
0	Adaptive filter: invalid	Parameter s related to 3rd and 4th notch filter remain unchanged
1	Adaptive filter: 1 filter valid for once.	1 adaptive filter becomes valid. 3rd notch filter related Parameter s updated accordingly. PR2.00 switches automatically to 0 once updated.
2	Adaptive filter: 1 filter remains valid	1 adaptive filter becomes valid. 3rd notch filter related Parameter s will keep updating accordingly.
3-4	Reserved	-

PR2.01	Label	1st notch frequency	Mode	F		
	Range	50~4000	Default	4000	Unit	Hz
	Activation	Immediate			Index	2201h

Set center frequency of 1st torque command notch filter. Set PR2.01 to 4000 to deactivate notch filter

PR2.02	Label	1st notch bandwidth	Mode	F		
	Range	0~20	Default	4	Unit	-
	Activation	Immediate			Index	2202h

Set notch bandwidth for 1st resonant notch filter.

Under normal circumstances, please use factory default settings. If resonance is under control, in combination with PR2.01 and PR2.03, PR2.02 can be reduced to improve current loop responsiveness which allows higher mechanical stiffness settings.

PR2.03	Label	1st notch depth	Mode	F		
	Range	0~99	Default	0	Unit	-
	Activation	Immediate			Index	2203h

Set notch depth for 1st resonant notch filter.

Under normal circumstances, please use factory default settings. If resonance is under control, in combination with PR2.01 and PR2.02, PR2.03 can be reduced to improve current loop responsiveness which allows higher mechanical stiffness settings

PR2.04	Label	2nd notch frequency	Mode	F		
	Range	50~4000	Default	4000	Unit	Hz
	Activation	Immediate			Index	2204h

Set center frequency of 2nd torque command notch filter. Set PR2.04 to 4000 to deactivate notch filter

PR2.05	Label	2nd notch bandwidth	Mode	F		
	Range	0~20	Default	4	Unit	-
	Activation	Immediate			Index	2205h

Set notch bandwidth for 2nd resonant notch filter.

Under normal circumstances, please use factory default settings. If resonance is under control, in combination with PR2.04 and PR2.06, PR2.05 can be reduced to improve current loop responsiveness which allows higher mechanical stiffness settings.

PR2.06	Label	2nd notch depth	Mode	F		
	Range	0~99	Default	0	Unit	-
	Activation	Immediate			Index	2206h

Set notch depth for 1st resonant notch filter.

When PR2.06 value is higher, notch depth becomes shallow, phase lag reduces. Under normal circumstances, please use factory default settings. If resonance is under control, in combination with PR2.04 and PR2.05, PR2.06 can be reduced to improve current loop responsiveness which allows higher mechanical stiffness settings.

PR2.07	Label	3rd notch frequency	Mode	F		
	Range	50~4000	Default	4000	Unit	Hz
	Activation	Immediate			Index	2207h

Set center frequency of 3rd torque command notch filter. Set PR2.07 to 4000 to deactivate notch filter

PR2.08	Label	3rd notch bandwidth	Mode	F		
	Range	0~20	Default	4	Unit	-
	Activation	Immediate			Index	2208h

Set notch bandwidth for 3rd resonant notch filter.

Under normal circumstances, please use factory default settings.

PR2.09	Label	3rd notch depth	Mode	F		
	Range	0~99	Default	0	Unit	-
	Activation	Immediate			Index	2209h

Set notch depth for 3rd resonant notch filter.

When PR2.09 value is higher, notch depth becomes shallow, phase lag reduces.

PR2.14	Label	1st damping frequency	Mode	F		
	Range	0~2000	Default	0	Unit	0.1Hz
	Activation	Immediate			Index	2214h

0: Deactivate

To suppress wobble at load end. Often used when wobble of flexible structure due to high deceleration upon stopping. Especially effective for wobble with frequencies under 100Hz. Set PR2.15 to wobble frequency (wobble frequency can be determined using tracing function of Optimus Tuning Software)

PR2.16	Label	2nd damping frequency	Mode	F		
	Range	0~2000	Default	0	Unit	0.1Hz
	Activation	Immediate			Index	2216h

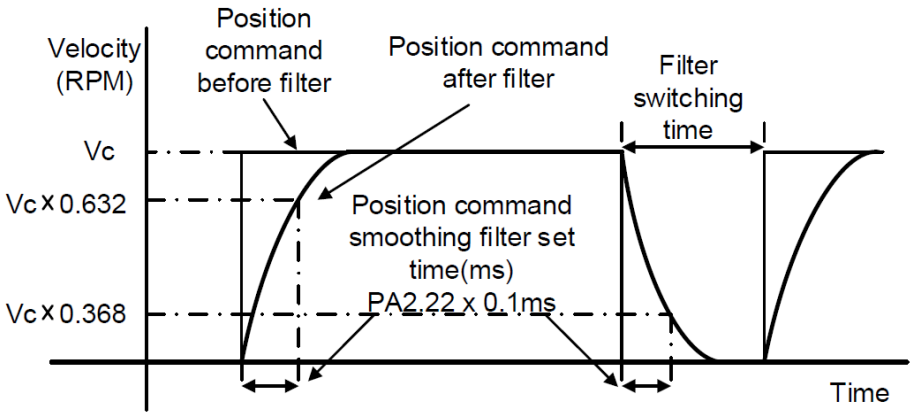
0: Deactivate

To suppress wobble at load end. Often used when wobble of flexible structure due to high deceleration upon stopping. Especially effective for wobble with frequencies under 100Hz. Set PR2.16 to wobble frequency (wobble frequency can be determined using tracing function of Optimus Tuning Software)

PR2.22	Label	Position command smoothing filter	Mode	PP	HM	CSP
	Range	0~32767	Default	300	Unit	0.1ms
	Activation	After stopping			Index	2222h

To set time constant of 1 time delay filter of position command.

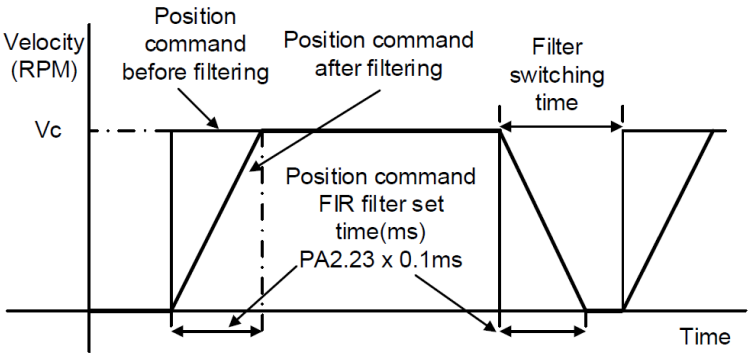
To set time constant of 1 time delay filter, according to target velocity Vc square wave command as show below.



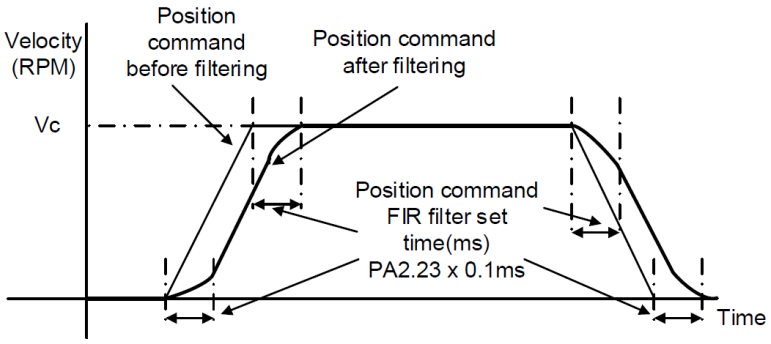
Usually applied when there is rather sharp acceleration which might cause motor overshoot or undershoot. To smoothen command signal, reduces impact to machines and eliminate vibration. If PR2.22 is set too high, overall time will be lengthened.

PR2.23	Label	Position command FIR filter	Mode	PP	HM	CSP
	Range	0~10000	Default	0	Unit	0.1ms
	Activation	After disabling			Index	2223h

As shown below, when target velocity Vc square wave command reaches Vc, it becomes trapezoidal wave after filtering.



As shown below, when target velocity Vc trapezoidal command reaches Vc, it becomes S wave after filtering.



Usually applied when there is rather sharp acceleration which might cause motor overshoot or undershoot. To smoothen command signal, reduces impact to machines and eliminate vibration. If PR2.23 is set too high, overall time will be lengthened.

***Please wait for command to stop and after filter idle time to modify PR2.23. Filter switching time = (PR2.23 set value x 0.1ms + 0.25ms)*

PR2.31	Label	5th resonant frequency	Mode	F		
	Range	50~4000	Default	4000	Unit	Hz
	Activation	Immediate			Index	2231h

To set zero-valued eigenfrequency of 5th resonant notch filter. PR2.31 corresponds to machine specific resonant frequency.

Notch filter deactivated if PR2.31 is set to any value.

PR2.32	Label	5th resonant Q value	Mode	F		
	Range	0~10000	Default	0	Unit	Hz
	Activation	Immediate			Index	2232h

To set notch Q value of 5th resonant notch filter

PR2.33	Label	5th anti-resonant frequency	Mode	F		
	Range	50~4000	Default	4000	Unit	Hz
	Activation	Immediate			Index	2233h
To set zero-valued eigenfrequency of 5th resonant notch filter. PR2.31 corresponds to machine-specific anti-resonant frequency.						

PR2.34	Label	5th anti-resonant Q value	Mode	F		
	Range	0~9900	Default	0	Unit	Hz
	Activation	Immediate			Index	2234h
To set resonant Q value of 5th resonant notch filter						

PR2.35	Label	6th resonant frequency	Mode	F		
	Range	50~4000	Default	4000	Unit	Hz
	Activation	Immediate			Index	2235h
To set zero-valued eigenfrequency of 6th resonant notch filter. PR2.35 corresponds to machine-specific resonant frequency. Notch filter deactivated if PR2.35 is set to any value.						

PR2.36	Label	6th resonant Q value	Mode	F		
	Range	0~10000	Default	0	Unit	Hz
	Activation	Immediate			Index	2236h
To set notch Q value of 6th resonant notch filter						

PR2.37	Label	6th anti-resonant frequency	Mode	F		
	Range	50~4000	Default	4000	Unit	Hz
	Activation	Immediate			Index	2237h
To set zero-valued eigenfrequency of 6th resonant notch filter. PR2.37 corresponds to machine-specific anti-resonant frequency.						

PR2.38	Label	6th anti-resonant Q value	Mode	F		
	Range	0~9900	Default	0	Unit	Hz
	Activation	Immediate			Index	2238h
To set resonant Q value of 6th resonant notch filter						

PR2.48	Label	Adjustment mode	Mode	F		
	Range	0~1	Default	0	Unit	-
	Activation	Immediate			Index	2248h

To turn on/off automatic adjustments

Set value	Description
【0】	Turn off automatic adjustments
1	Activate automatic adjustments, real time inertia measuring and vibration suppression. Inertia measuring deactivated after reaching 4 times in 5 minutes, triggering conditions: changes in mechanical stiffness.

PR2.50	Label	MFC type	Mode	PP	CSP	
	Range	0~3	Default	0	Unit	Hz
	Activation	After restart			Index	2250h

Set value	Description
【0】	Model following control
1	Zero tracking control
2	*3 inertias (future upgrade)*
3	*Path following (future upgrade)*

PR2.51	Label	Velocity feedforward compensation coefficient	Mode	PP	CSP	
	Range	-10000~ 10000	Default	0	Unit	-
	Activation	Immediate			Index	2251h

To compensate for velocity feedforward

PR2.52	Label	Torque feedforward compensation coefficient	Mode	PP	PV	CSP	CSV
	Range	-10000~ 10000	Default	0	Unit	-	
	Activation	Immediate			Index	2252h	

To compensate for velocity feedforward

PR2.53	Label	Dynamic friction compensation coefficient	Mode	F		
	Range	0~1000	Default	0	Unit	%
	Activation	Immediate			Index	2253h

To set ratio of rated torque/rated rotational speed, to compensate for dynamic friction during motion and have better control over acceleration/deceleration.

$$\text{Dynamic friction coefficient} = \left| \frac{\text{Torque(Rotational speed 1)} - \text{Torque(Rotational speed 2)}}{\text{Rotational speed 1} - \text{Rotational speed 2}} * \text{rated rotational speed} \right|$$

When there is an excess position deviation during acceleration/deceleration, please adjust PR2.53 to reduce the deviation to 0.

PR2.54	**Label**	Overtravel time coefficient	**Mode**	**F**		
	Range	0~10000	**Default**	0	**Unit**	-
	Activation	Immediate			**Index**	2254h
To set overtravel time coefficient						

PR2.55	**Label**	Overtravel suppression gain	**Mode**	**F**		
	Range	0~1000	**Default**	0	**Unit**	-
	Activation	Immediate			**Index**	2255h
Suppression improves with larger set value but might affect the performance of MFC. Please use with caution for any value above 100.						

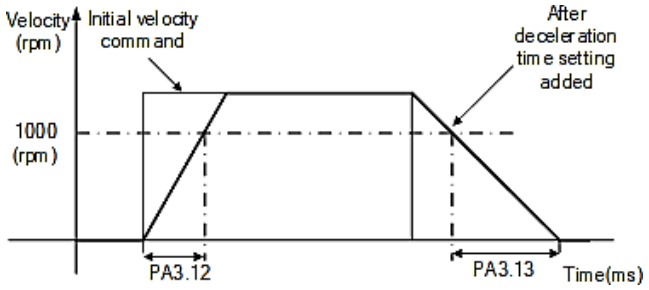
3.2.4 【Class 3】Velocity Control

PR3.12	**Label**	Acceleration time		**Mode**	**PV**	**CSV**
	Range	0~10000	**Default**	0	**Unit**	ms/(1000RPM)
	Activation	Immediate			**Index**	2312h
PR3.13	**Label**	Deceleration time		**Mode**	**PV**	**CSV**
	Range	0~10000	**Default**	0	**Unit**	ms/(1000RPM)
	Activation	Immediate			**Index**	2313h

Set max acceleration/deceleration for velocity command.

If target velocity = *x* [rpm], max acceleration = *a* [unit: rpm/ms], acceleration time = *t* [ms] PR3.12 = *1000/a*
PR3.13 = *1000/a*
a = x/t

For example: If motor is to achieve 1500rpm in 30s, *a=1500/30=50rpm/ms*
PR3.12 = 1000/*a= 20.* Hence when PR3.12 = 20, motor can achieve 1500rpm in 30s.

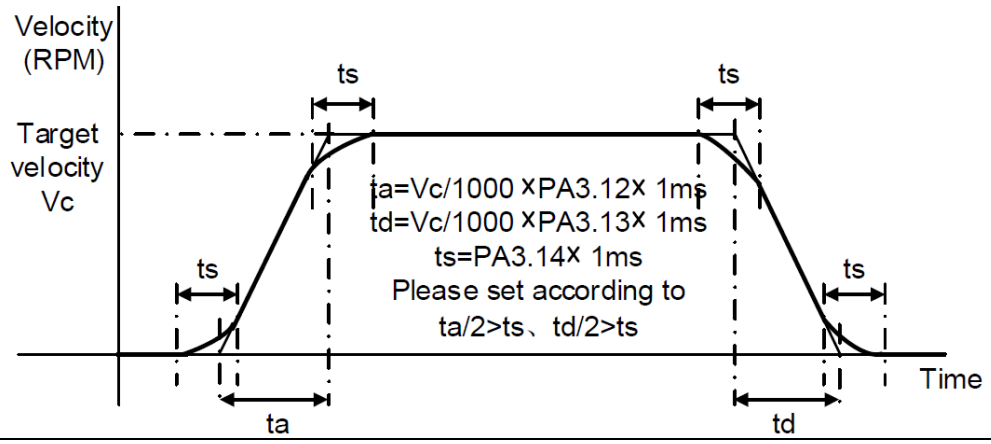


Usually used when there is rapid acceleration or trapezoidal wave velocity command due to many different internal speed segments under velocity control mode which causes instable while motor in motion.

Under velocity control mode, 6083 and 6084 is limited by PR3.12 and PR3.13 correspondingly.

PR3.14	Label	Sigmoid acceleration/deceleration settings	Mode	PV		CSV
	Range	0~1000	Default	0	Unit	ms
	Activation	After disabling			Index	2314h

To set sigmoid acceleration and deceleration turning point in accordance to PR3.12 and PR3.13.



PR3.15	Label	Zero speed clamp function selection	Mode	F		
	Range	0~3	Default	0	Unit	-
	Activation	Immediate			Index	2315h

Set value	Zero speed clamp function
0	Invalid: zero speed clamp deactivated
1	Velocity command is forced to 0 when the zero speed clamp (ZEROSPD) input signal is valid.
2	Velocity command is forced to 0 when actual velocity is lower than PR3.16.
3	Includes conditions from 1 and 2

PR3.16	Label	Zero speed clamp level	Mode	PV		CSV
	Range	10~2000	Default	30	Unit	rpm
	Activation	Immediate			Index	2316h

Velocity command is forced to 0 when actual velocity is lower than PR3.16 and after static time set in PR3.23

PR3.23	Label	Zero speed clamp static time	Mode	PV		CSV
	Range	0~32767	Default	0	Unit	ms
	Activation	Immediate			Index	2323h

To set delay time for zero speed clamp.

To prevent creeping at low speed, velocity command forced to 0 when velocity goes under PR3.16 after time set in PR3.23

3.2.5 【Class 4】I/O Interface Setting

PR4.00	Label	Input selection DI1	Mode	F		
	Range	0x0~0xFF	Default	0x0	Unit	-
	Activation	Immediate			Index	2400h
PR4.01	Label	Input selection DI2	Mode	F		
	Range	0x0~0xFF	Default	0x0	Unit	-
	Activation	Immediate			Index	2401h
PR4.02	Label	Input selection DI3	Mode	F		
	Range	0x0~0xFF	Default	0x0	Unit	-
	Activation	Immediate			Index	2402h
PR4.03	Label	Input selection DI4	Mode	F		
	Range	0x0~0xFF	Default	0x0	Unit	-
	Activation	Immediate			Index	2403h
PR4.04	Label	Input selection DI5	Mode	F		
	Range	0x0~0xFF	Default	0x0	Unit	-
	Activation	Immediate			Index	2404h
PR4.05	Label	Input selection DI6	Mode	F		
	Range	0x0~0xFF	Default	0x0	Unit	-
	Activation	Immediate			Index	2405h

Digital input DI allocation using hexadecimal system

Input	Symbol	Set value		0x60FD (bit)
		Normally open	Normally close	
Invalid	—	0h	-	×
Positive limit switch	POT	1h	81h	Bit1
Negative limit switch	NOT	2h	82h	Bit0
Clear alarm	A-CLR	4h	-	×
Forced alarm	E-STOP	14h	94h	×
Home switch	HOME-SWITCH	16h	96h	Bit2

- Please don't set anything other than listed in table above.
- Normally open: Valid when input = ON Normally close: Valid when input = OFF
- Er210 might occur if same function is allocated to different channels at the same time
- Channel that has no value doesn't affect driver motion.
- Front Panel is of hexadecimal system.

PR4.00 – PR4.05 corresponds to DI1 – DI6. External sensors can be connected if the Parameter s are all set to 0. Controller will read 60FD bit4 – 11 to get DI1 – DI6 actual status.

PR4.10	Label	Output selection DO1	Mode	F		
	Range	0x0~0xFF	Default	0x0	Unit	-
	Activation	Immediate			Index	2410h
PR4.11	Label	Output selection DO2	Mode	F		
	Range	0x0~0xFF	Default	0x0	Unit	-
	Activation	Immediate			Index	2411h

PR4.12	Label	Output selection DO3	Mode	F		
	Range	0x0~0xFF	Default	0x0	Unit	-
	Activation	Immediate			Index	2412h

Digital output DO allocation using hexadecimal system.

Output	Symbol	Set value	
		Normally open	Normally close
Master device control	—	00h	-
Alarm	ALM	01h	81h
Servo-Ready	S-RDY	02h	82h
External brake released	BRK-OFF	03h	83h
Positioning completed	INP	04h	84h
At-speed	AT-SPEED	05h	85h
Torque limit signal	TLC	06h	86h
Zero speed clamp detection	ZSP	07h	87h
Velocity coincidence	V-COIN	08h	88h
Position command ON/OFF	P-CMD	0Bh	8Bh
Velocity limit signal	V-LIMIT	0Dh	8Dh
Velocity command ON/OFF	V-CMD	0Fh	8Fh
Servo status	SRV-ST	12h	92h
Homing done	HOME-OK	22h	A2h
Position comparison	CMP-OUT	14h	94h

Please don't set any other than the outputs listed in the table above.

- Normally open: Active low
- Normally close: Active high
- Front Panel is of hexadecimal system.

PR4.10 – PR4.12 corresponds to DO1 – DO3. If all Parameter s are set to 0, master device controls the outputs, object dictionary 0x60FE sub-index 01 bit16-18 corresponds to DO1-DO3.

PR4.31	Label	Positioning complete range	Mode	PP	HM	CSP
	Range	0~10000	Default	20	Unit	*Command*
	Activation	Immediate			Index	2431h

To set position deviation range of INP1 positioning completed output signal.

PR4.32	Label	Positioning complete output settings	Mode	PP	HM	CSP
	Range	0~4	Default	1	Unit	-
	Activation	Immediate			Index	2432h

Output conditions of INP1 positioning completed output signal

Set value	Positioning completed signal
0	Signal valid when the position deviation is smaller than PR4.31
1	Signal valid when there is no position command and position deviation is smaller than PR4.31
2	Signal valid when there is no position command, zero-speed clamp detection (ZSP) signal is ON and the positional deviation is smaller than PR4.31
3	Signal valid when there is no position command and position deviation is smaller than PR4.31. Signal ON when within the time set in PR4.33 otherwise OFF.
4	When there is no command, position detection starts after the delay time set in PR4.33. Signal valid when there is no position command and positional deviation is smaller than PR4.31.

PR4.33	Label	INP positioning delay time	Mode	PP	HM	CSP
	Range	0~15000	Default	0	Unit	1ms
	Activation	Immediate			Index	2433h

To set delay time when PR 4.32 = 3

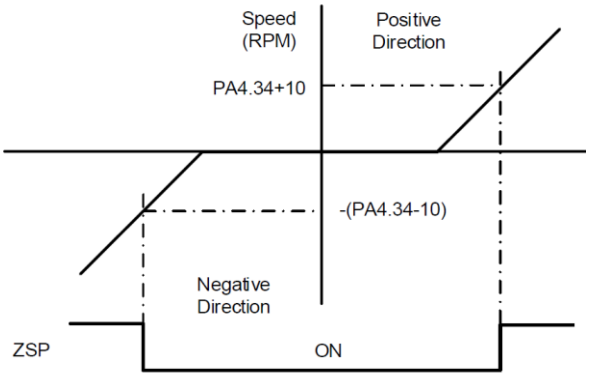
Set value	Positioning completed signal
0	Indefinite delay time, signal ON until next position command
1-15000	OFF within the time set; ON after time set. Switch OFF after receiving next position command.

PR4.34	Label	Zero speed	Mode	F		
	Range	1~2000	Default	50	Unit	RPM
	Activation	Immediate			Index	2434h

To set threshold value for zero speed clamp detection.

Zero speed clamp detection (ZSP) output signal valid when motor speed goes under the value set in PR4.34

- Disregard the direction of rotation, valid for both directions.
- Hysteresis of 10RPM. Please refer to diagram on the right side.

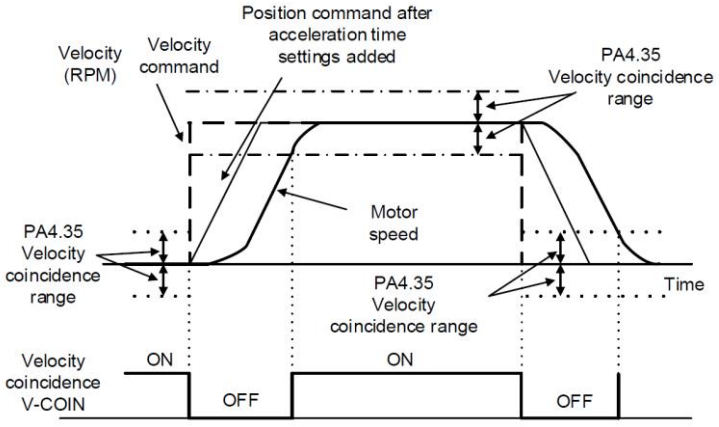


PR4.35	Label	Velocity coincidence range	Mode	PV		CSV
	Range	10~2000	Default	50	Unit	RPM
	Activation	Immediate			Index	2435h

If the difference between velocity command and motor actual speed is below PR4.35, Velocity coincidence (V-COIN) output signal valid.

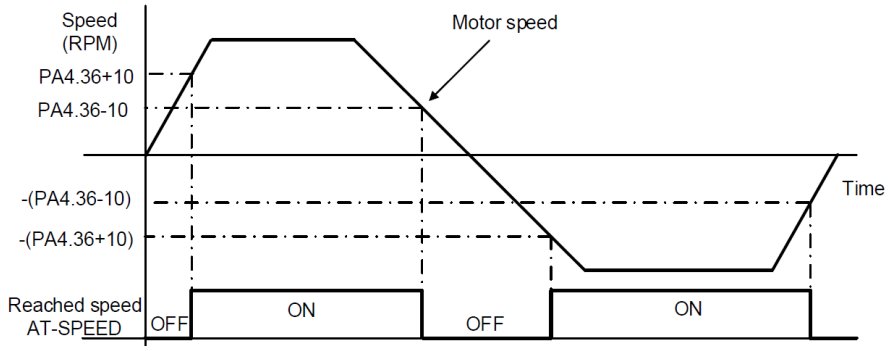
Due to 10RPM hysteresis:

Velocity coincidence output OFF -> ON timing (PR4.35 -10) r/min Velocity coincidence output ON -> OFF timing (PR4.35 +10) r/min



PR4.36	Label	Reached speed (AT-speed)	Mode	PV		CSV
	Range	10~2000	Default	1000	Unit	RPM
	Activation	Immediate			Index	2436h

When motor velocity > PR4.36, AT-speed output signal is valid. Detection using 10RPM hysteresis



PR4.37	Label	Motor power-off delay time	Mode	F		
	Range	0~3000	Default	100	Unit	1ms
	Activation	Immediate			Index	2437h

To set delay time for holding brake to be activated after motor power off to prevent axis from sliding.

PR4.38	Label	Delay time for holding brake release	Mode	F		
	Range	0~3000	Default	0	Unit	1ms
	Activation	Immediate			Index	2438h

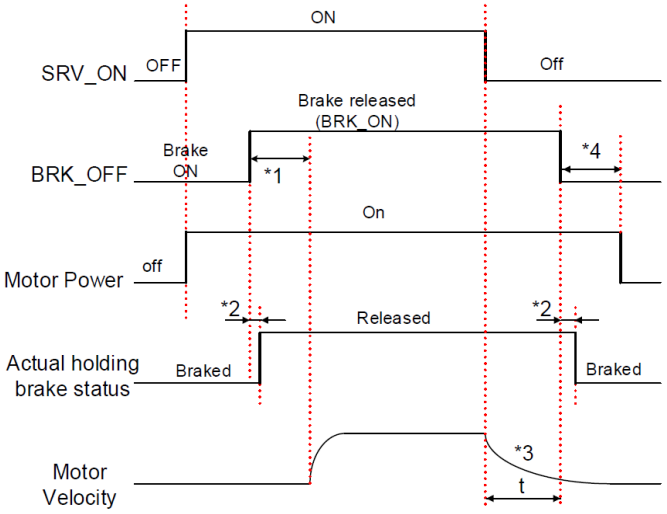
To set delay time for holding brake to be released after motor power on. Motor will remain at current position and input command is masked to allow holding brake to be fully released before motor is set in motion.

*1: Delay time set in PR4.38

*2: Delay time from the moment BRK_OFF signal is given until actual holding brake is released or BRK_ON signal is given until actual holding brake is activated. It is dependent on the holding brake of the motor.

*3: Deceleration time is determined by PR6.14 or if motor speed goes below PR4.39, whichever comes first. BRK_OFF given after deceleration time.

*4: PR4.37 set time value.



Delay time from the moment SRV_ON is given until BRK_OFF switch to BRK_ON, is less than 500ms.

PR4.39	Label	Holding brake activation speed	Mode	F		
	Range	30~3000	Default	30	Unit	RPM
	Activation	Immediate			Index	2439h

To set the activation speed for which holding brake will be activated.
When SRV-OFF signal is given, motor decelerates, after it reaches below PR4.39 and PR6.14 is not yet reached, BRK_OFF is given.
BRK_OFF signal is determined by PR6.14 or if motor speed goes below PR4.39, whichever comes first.
Application:
1. After disabling axis, PR6.14 has been reached but motor speed is still above PR4.39, BRK_OFF signal given.
2. After disabling axis, PR6.14 has not been reached but motor speed is below PR4.39,
BRK_OFF signal given.

PR4.43	Label	Emergency stop function	Mode	F		
	Range	0~1	Default	0	Unit	-
	Activation	Immediate			Index	2443h

0：Emergency stop is valid, servo driver will be forced to STOP and alarm occurs. 1：Emergency stop is invalid; servo driver will not be forced to STOP.

PR4.48	Label	Torque compensation time upon enabling	Mode	F		
	Range	0~3000	Default	0	Unit	ms
	Activation	Immediate			Index	2448h

Torque compensation at the enabling of the servo drive can be turned on through PR6.10. Torque compensation time is set using PR4.48. Torque will increase as the motor is enabled and reduce until diminished in the time duration set in PR4.48.
When PR4.48 is set at default of 0s, continuous torque compensation duration will be 1000ms

3.2.6 【Class 5】Extension settings

PR5.04	Label	Driver prohibition input settings	Mode	F		
	Range	0~2	Default	0	Unit	-
	Activation	Immediate			Index	2504h

To set driver prohibition input (POT/NOT): If set to 1, no effect on homing mode.

Set value	Description
0	POT → Positive direction drive prohibited NOT → Negative direction drive prohibited
1	POT and NOT invalid
2	Any single sided input from POT or NOT might cause Er260

In homing mode, POT/NOT invalid, please set object dictionary 5012-04 bit0=1

PR5.06	Label	Servo-off mode	Mode	F		
	Range	0~5	Default	0	Unit	-
	Activation	After restart			Index	2506h

To set servo driver disable mode and status.

Value	Description	
	Mode	Status
0	Servo braking	Dynamic braking
1	Free stopping	Dynamic braking
2	Dynamic braking	Dynamic braking
3	Servo braking	Free-run
4	Free stopping	Free-run
5	Dynamic braking	Free-run

PR5.09	Label	Main power-off detection time	Mode	F		
	Range	50~2000	Default	50	Unit	ms
	Activation	Immediate			Index	2509h

To set duration time for detection of main power-off or low voltage supply.

PR5.10	Label	Servo-off due to alarm mode	Mode	F		
	Range	0~5	Default	0	Unit	-
	Activation	After restart			Index	2510h

To set servo driver disable mode and status if alarm is triggered. Alarm type 2:

Value	Description	
	Mode	Status
0	Servo braking	Dynamic braking
1	Free stopping	Dynamic braking
2	Dynamic braking	Dynamic braking
3	Servo braking	Free-run
4	Free stopping	Free-run
5	Dynamic braking	Free-run

Alarm type 1:

Value	Description	
	Mode	Status
0	Dynamic braking	Dynamic braking
1		
2		
3	Servo braking	Free-run
4	Free stopping	Free-run
5	Dynamic braking	Free-run

PR5.11	Label	Servo braking torque setting	Mode	F		
	Range	0~500	Default	0	Unit	%
	Activation	Immediate			Index	2511h

To set torque limit for servo braking mode.

If PR5.11 = 0, use torque limit as under normal situation.

Between max. torque 6072 and PR5.11, actual torque limit will take smaller value.

PR5.12	Label	Overload level setting	Mode	F		
	Range	0~115	Default	0	Unit	%
	Activation	Immediate			Index	2512h

If PR5.12 = 0, overload level = 115%

Use only when overload level degradation is needed.

PR5.13	Label	Overspeed level setting	Mode	F		
	Range	0~10000	Default	0	Unit	RPM
	Activation	Immediate			Index	2513h

If motor speed exceeds PR5.13, Er1A0 might occur.

When PR5.13 = 0, overspeed level = max. motor speed x 1.2

PR5.15	Label	I/O digital filter	Mode	F		
	Range	0~255	Default	10	Unit	0.1ms
	Activation	Immediate			Index	2515h

Digital filtering of I/O input. Overly large value set will cause control delay.

PR5.20	Label	Position unit setting	Mode	PP	HM	CSP
	Range	0~2	Default	2	Unit	-
	Activation	After restart			Index	2520h

Set value	Unit
0	Encoder unit
1	Command unit
2	0.0001rev

Command unit: Pulse from host (Affected by electronic gear ratio) Encoder unit: Pulse from encoder (Related to encoder resolution)

PR5.20 can only be modified when axis is disabled as it will clear position data.

PR5.21	Label	Torque limit selection	Mode	F		
	Range	0~2	Default	0	Unit	-
	Activation	Immediate			Index	2521h

Set value	Positive limit value	Negative limit value
0	PR0.13	PR0.13
1	PR0.13	PR5.22
2	60E0	60E1

Between max. torque 6072 and PR5.21, actual torque limit will take smaller value.

PR5.22	Label	2nd Torque limit	Mode	F		
	Range	0~500	Default	300	Unit	%
	Activation	Immediate			Index	2522h

Limited by motor max. torque.

Between max. torque 6072 and PR5.22, actual torque limit will take smaller value.

PR5.28	Label	LED initial status	Mode	F		
	Range	0~42	Default	34	Unit	-
	Activation	After restart			Index	2528h

To set content display on front Panel of the servo driver at servo driver power on.

Set value	Content	Set value	Content	Set value	Content
0	Position command deviation	15	Overload rate	30	No. of encoder communication error
1	Motor speed	16	Inertia ratio	31	Accumulated operation time
2	Position command velocity	17	No rotation cause	32	Automatic motor identification
3	Velocity control command	18	No. of changes in I/O signals	33	Driver temperature
4	Actual feedback torque	19	Number of over current signals	34	Servo status
5	Sum of feedback pulse	20	Absolute encoder data	35	/
6	Sum of command pulse	21	Single turn position	36	Synchronous period
7	Maximum torque during motion	22	Multiturn position	37	No. of synchronous loss
8	/	23	Communication axis address	38	Synchronous type
9	Control mode	24	Encoder position deviation	39	Whether DC is running or not
10	I/O signal status	25	Motor electrical angle	40	Acceleration/ Deceleration status
11	/	26	Motor mechanical angle	41	Sub-index of OD index
12	Error cause and history record	27	Voltage across PN	42	Value of sub-index of OD index
13	Alarm code	28	Software version		
14	Regenerative load rate	29	/		

PR5.37	Label	Torque limit duration during homing	Mode	F		
	Range	0~5000	Default	500	Unit	ms
	Activation	Immediate			Index	2537h

To set time threshold for output torque to reach limit under torque initialization mode.

Only applicable for torque initialization method -6 to -1

Under torque initialization mode, motor torque reached PR5.39 and the duration reach PR5.37 before moving into next step.

PR5.39	Label	3rd torque limit	Mode	F		
	Range	0~500	Default	80	Unit	%
	Activation	Immediate			Index	2539h
To set torque limit during torque initialization Between max. torque 6072 and PR5.37, actual torque limit will take smaller value.						

PR5.40	Label	D41 set value	Mode	F		
	Range	0x0~0xFFFFF	Default	0X30C	Unit	%
	Activation	Immediate			Index	2540h
Set object word monitored by D41, index (left 4 bits) + sub-index (right 1 bit), if monitoring 0x6092-01, set PR5.40 to 0x60921.						

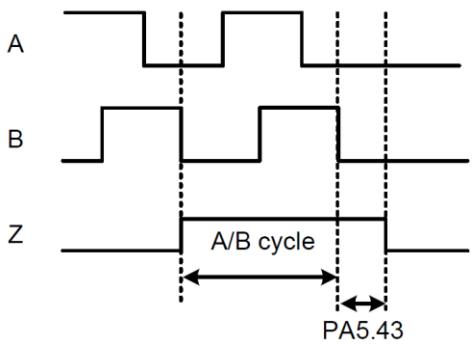
PR5.42	Label	Frequency divider output - ABZ signal polarity	Mode	F		
	Range	0~7	Default	0	Unit	-
	Activation	After restart			Index	2542h

Bit	Polarity	Description
Bit0	0 = Positive 1 = Negative	Z polarity setting of frequency divider output and position comparison
Bit1	0 = Positive 1 = Negative	Only valid in position comparison. Polarity setting when phase A frequency divider as position comparison output
Bit2	0 = Positive	Only valid in position comparison. Polarity setting when phase B frequency divider as position comparison output

PR5.43	Label	Frequency divider output – Z-signal width	Mode	F		
	Range	0~500	Default	0	Unit	μs
	Activation	After restart			Index	2543h

Set value	Description
【0】	Z bandwidth equivalent to 1 cycle of A/B
1~500	Delay setting on top of A/B cycle width

When PR5.43 = 0, width of frequency divider output Z-signal is equivalent to width of 1 cycle of A/B, value set in PR5.43 + A/B cycle width = delay setting.



PR5.44	Label	Frequency divider output source	Mode	F		
	Range	0~4	Default	0	Unit	-
	Activation	After restart			Index	2544h

Set Value	Description
【0】	Position feedback of encoder #1(motor encoder)
1	Reserved
2	Reserved
3	Pulse input command position synchronous output; position comparison not available in this mode
4	Frequency divider output prohibited

PR5.46	Label	Vent overload level	Mode	F		
	Range	0~115	Default	0	Unit	%
	Activation	Immediate			Index	2546h

Set value		Description
【0】		Default level: 80%
1~115		Set vent overload level accordingly

3.2.7 【Class 6】Other settings

PR6.01	Label	Encoder zero position compensation	Mode	F		
	Range	0~360	Default	0	Unit	°
	Activation	After restart			Index	2601h
Angle of the encoder after zero position calibration						

PR6.03	Label	JOG trial run torque command	Mode	F		
	Range	0~350	Default	350	Unit	%
	Activation	Immediate			Index	2603h
To set torque for JOG trial run command.						

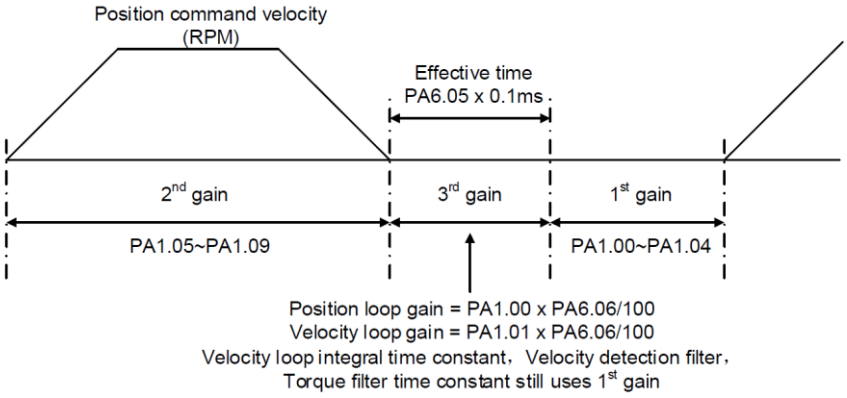
PR6.04	Label	JOG trial run velocity command	Mode	F		
	Range	0~10000	Default	30	Unit	r/min
	Activation	Immediate			Index	2604h
To set velocity for JOG trial run command.						

PR6.05	Label	Position 3rd gain valid time	Mode	PP	HM	CSP
	Range	0~10000	Default	0	Unit	0.1ms
	Activation	Immediate			Index	2605h

To set time for 3rd gain to be valid When not in use, set PR6.05=0, PR6.06=100

PR6.06	Label	Position 3rd gain scale factor	Mode	PP	HM	CSP
	Range	0~1000	Default	100	Unit	100%
	Activation	Immediate			Index	2606h

Set up the 3rd gain by multiplying factor of the 1st gain
Position loop gain = PR1.00 x PR6.06/100 Velocity loop gain = PR1.01 x PR6.06/100
Velocity loop integral time constant Velocity detection filter， Torque filter time constant still uses 1st gain



Above diagram is illustrated using PR1.15 = 7. 3rd gain= 1st gain * PR6.06/100
Only effective under position control mode. 3rd gain valid when PR6.05 ≠ 0. Set 3rd gain value in PR6.06.
When 2nd gain switches to 1st gain, it will go through 3rd, switching time is set in PR1.19.

PR6.07	Label	Torque command additional value	Mode	F		
	Range	-100~100	Default	0	Unit	%
	Activation	Immediate			Index	2607h

To set torque forward feed additional value of vertical axis. Applicable for loaded vertical axis, compensate constant torque.
Application: When load move along vertical axis, pick any point from the whole motion and
stop the load at that particular point with motor enabled but not rotating. Record output torque value from d04, use that value as torque comman
additional value (compensation value)

PR6.08	Label	Positive direction torque compensation value	Mode	F		
	Range	-100~100	Default	0	Unit	%
	Activation	Immediate			Index	2608h
PR6.09	Label	Negative direction torque compensation value	Mode	F		
	Range	-100~100	Default	0	Unit	%
	Activation	Immediate			Index	2609h

To reduce the effect of mechanical friction in the movement(s) of the axis. Compensation
values can be set according to needs for both rotational directions.
Applications:
When motor is at constant speed, d04 will deliver torque values.
Torque value in positive direction = T1;
Torque value in negative direction = T2
PR6.08/PR6.09 = Tf =|T1-T2|/2

PR6.10	Label	Torque compensation upon enabling	Mode	F		
	Range	0x0 ~ 0xFFFF	Default	0x0	Unit	-
	Activation	Immediate			Index	2610h

In applications with vertical load axis, servo drive will automatically increase the motor torque to compensate for the gravitational force at enabling of the drive. In order to prevent the axis from having a slight drop and back to initial position behavior, PR6.10 can be set to turn on torque compensation.

Set 0x0010： ON

Set 0x0 ： OFF

PR6.11	Label	Current response setting	Mode	F		
	Range	50~100	Default	100	Unit	%
	Activation	Immediate			Index	2611h

To set driver current loop related effective value ratio

PR6.14	Label	Max. time to stop after disabling	Mode	F		
	Range	0~3000	Default	500	Unit	ms
	Activation	Immediate			Index	2614h

To set the max. time allowed for the axis to stop on emergency stop or normal axis disabling. After disabling axis, if motor speed is still higher than PR4.39 but the time set in PR6.14 is reached, BRK_ON given and holding brake activated.

BRK_ON given time is determined by PR6.14 or when motor speed goes below PR4.39, whichever comes first.

Applications:

1. After disabling axis, if motor speed is still higher than PR4.39 but the time set in PR6.14 is reached, BRK_ON given and holding brake activated.
2. After disabling axis, if motor speed is already lower than PR4.39 but the time set in PR6.14 is not yet reached, BRK_ON given and holding brake activated.

PR6.20	Label	Trial run distance	Mode	F		
	Range	0~1200	Default	10	Unit	0.1rev
	Activation	Immediate			Index	2620h

JOG (Position control) : Distance travel of each motion

PR6.21	Label	Trial run waiting time	Mode	F		
	Range	0~30000	Default	300	Unit	ms
	Activation	Immediate			Index	2621h

JOG (Position control): Waiting time after each motion

PR6.22	Label	No. of trial run cycles	Mode	F		
	Range	0~32767	Default	5	Unit	-
	Activation	Immediate			Index	2622h

JOG (Position control): No. of cycles

PR6.25	Label	Trial run acceleration	Mode	F		
	Range	0~10000	Default	200	Unit	ms/ (1000rpm)
	Activation	Immediate			Index	2625h

To set the acceleration/deceleration time for JOG command between 0 rpm to 1000 rpm

PR6.28	Label	Velocity observer gain	Mode	F		
	Range	0~32767	Default	0	Unit	-
	Activation	Immediate			Index	2628h

0: Default stable gain; Modifications are not recommended.

PR6.29	Label	Velocity observer bandwidth	Mode	F		
	Range	0~32767	Default	0	Unit	-
	Activation	Immediate			Index	2629h

0: Default stable bandwidth; Modifications are not recommended.

PR6.34	Label	Frame error window time	Mode	F		
	Range	0~32767	Default	100	Unit	-
	Activation	Immediate			Index	2634h

To set EtherCAT data frame error detection window time

PR6.35	Label	Frame error window	Mode	F		
	Range	0~32767	Default	50	Unit	-
	Activation	Immediate			Index	2635h

To set EtherCAT data frame error detection window

PR6.54	Label	Absolute value rotation mode denominator setting	Mode	PP	HM	CSP
	Range	0~32766	Default	0	Unit	-
	Activation	After restart			Index	2654h

To set denominator of absolute encoder in rotational mode.
When PR0.15 = 2 and use in combination with PR6.54:

$$\text{Feedback load position 6064} = \left|\frac{PA6.63}{PA6.54}\right| \times \text{Electronic gear ratio}$$

PR6.56	Label	Blocked rotor alarm torque threshold	Mode	F		
	Range	0~300	Default	300	Unit	%
	Activation	Immediate			Index	2656h

To set the torque threshold of blocked rotor to trigger alarm. (Alarm triggered if torque output% larger than threshold value & under 10rpm)

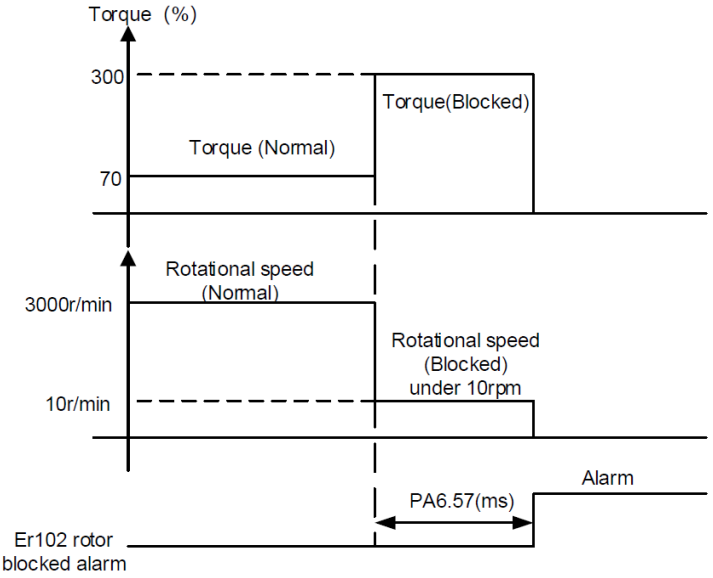
If PR6.56 = 0, blocked rotor alarm deactivated.

If motor speed is 10rpm or above, Er102 won't be triggered.

PR6.57	Label	Blocked rotor alarm delay time	Mode	F		
	Range	0~1000	Default	400	Unit	ms
	Activation	Immediate			Index	2657h

To set delay time for blocked rotor alarm to trigger, if rotor blocked duration is shorter than time set in PR6.57, Er102 won't be triggered.

Please look at the following diagram to set up Er102 alarm trigger.



**If rotational speed is more than 10rpm when motor rotor is blocked, Er100 will be triggered.*

PR6.59	Label	Homing mode position threshold	Mode	F		
	Range	0~100	Default	8	Unit	0.00001rev
	Activation	Immediate			Index	2659h

To set position threshold for homing mode.

PR6.61	Label	Z signal holding time	Mode	F		
	Range	0~100	Default	10	Unit	ms
	Activation	Immediate			Index	2661h

To set the holding time for Z signal to maintain active high Application:

1. Z signal for 60FDH;
2. Z signal for homing process
3. Z-phase frequency output pulse width. Unit = 0.1ms;

Please set PR6.61≥0.2ms if used for 3 applications as above

PR6.63	Label	Absolute multiturn data upper limit	Mode	F		
	Range	0~32766	Default	0	Unit	rev
	Activation	Immediate			Index	2663h

To set upper limit of multiturn data with absolute encoder set as rotational mode.

When PR0.15 = 2 and use in combination with PR6.54:

$$\text{Feedback load position 6064} = \frac{\text{PA6.63}}{\text{PA6.54}} \times \text{Electronic gear ratio}$$

3.2.8 【Class 7】Factory settings

Please take precaution when modifying Class 7 Parameter s. Might cause driver errors

PR7.15	Label	Motor model	Mode	F		
	Range	0x0~0x7FFF	Default	0x200	Unit	-
	Activation	After restart	Data length	16 bit	Property	R/W

Set value	Description
0x100	Read from EEPROM
[0x200]	Read from Encoder

When PR7.15 = 0x200(2xx):

Parameter	Label
PR7.00	Current loop gain
PR7.01	Current loop integral time
PR7.05	No. of motor pole pairs
PR7.06	Motor phase resistance
PR7.07	Motor D/Q induction
PR7.08	Motor back EMF coefficient
PR7.09	Motor torque coefficient
PR7.10	Motor rated rotational speed
PR7.11	Motor max. rotational speed
PR7.12	Motor rated current
PR7.13	Motor rotor inertia
PR7.14	Driver power rating
PR7.16	Encoder
PR7.17	Motor max. current
PR7.18	Encoder index angle compensation

PR7.16	Label	Encoder	Mode	F		
	Range	0x0~0x200	Default	*Encoder*	Unit	-
	Activation	After restart	Data length	16 bit	Property	R/W

Set value	Description
0x0	17-bit encoder
0x7	23-bit encoder

PR7.31	Label	Vent release mode	Mode	F		
	Range	0~1	Default	-	Unit	-
	Activation	After restart			Index	2731h

To set vent release mode

Power Rating(W)	Default	Description
400	1	Regenerative electricity absorbed by **internal capacitor**
750 or above	0	Regenerative electricity absorbed by **regenerative resistor**

3.3 CiA 402 Parameter s Function

Panel Display as follows:

Parameter Valid mode Description
CSP: Valid in cyclic synchronous position mode
CSV: Valid in cyclic synchronous velocity mode
CST: Valid in cyclic synchronous torque mode
HM: Valid in homing mode
PP: Valid in profile position mode
PV: Valid in profile velocity mode
PT: Valid in profile torque mode
F: Valid in all modes

Index 603Fh	Label	Error code			Mode	F		
	Range	0x0~0xFFFF			Default	0X0	Unit	-
	Structure	VAR	Type	Uint16	Mapping	TPDO	Access	RO
Please refer to Chapter 9 for more details on error codes.								

Index 6040h	Label	Control word			Mode	F		
	Range	0x0~0xFFFF			Default	0X0	Unit	-
	Structure	VAR	Type	Uint16	Mapping	RPDO	Access	RW

Bit	Label	Description
0	Start	1 - valid, 0 - invalid
1	Main circuit power on	1 - valid, 0 - invalid
2	Quick stop	0 - valid,1 - invalid
3	Servo running	1 - valid, 0 - invalid
4-6	Running mode related	Related to each servo running mode
7	Fault reset	Reset resettable fault alarm. Rising edge of Bit7 is valid, bit7 remains at 1, and all other instructions are invalid
8	Pruse	For more information on how to Pruse in each mode, refer to Object Dictionary 605Dh
9	No definition	Undefined
10	Reserved	Undefined
11-15	Reserved	Undefined

Index 6041h	Label	Status word			Mode	F		
	Range	0x0~0xFFFF			Default	0X0	Unit	-
	Structure	VAR	Type	Uint16	Mapping	TPDO	Access	RO

Bit	Label	Description
0	Servo ready	1 - valid, 0 - invalid
1	Start	1 - valid, 0 - invalid
2	Servo running	1 - valid, 0 - invalid
3	Fault	1 - valid, 0 - invalid
4	Main circuit power on	1 - valid, 0 - invalid
5	Quick stop	0- valid, 1 - invalid
6	Servo cannot run	1 - valid, 0 - invalid
7	Warning	1 - valid, 0 - invalid
8	Reserved	Reserved
9	Remote control	1 - valid, 0 - invalid
10	Arrived at position	1 - valid, 0 - invalid
11	Internal limit valid	1 - valid, 0 - invalid
12-13	Mode related	Related to each servo operation mode
14	Reserved	Reserved
15	Origin found	1 - valid, 0 - invalid

Index 605Ah	Label	Quick stop option code			Mode	F		
	Range	0~7			Default	2	Unit	-
	Structure	VAR	Type	INT16	Mapping	-	Access	RW

Motor stops when quick stop option code is given.

PP, CSP, CSV, PV

0 : To stop motor through PR5.06. Status: Switch on disable, axis disabled.

1 : Motor decelerates and stops through 6084. Status: Switch on disable, axis disabled.

2 : Motor decelerates and stops through 6085. Status: Switch on disable, axis disabled.

3 : Motor decelerates and stops through 60C6. Status: Switch on disable, axis disabled.

5 : Motor decelerates and stops through 6084. Status: Quick stop

6 : Motor decelerates and stops through 6085. Status: Quick stop

7 : Motor decelerates and stops through 60C6. Status: Quick stop

HM

0 : To stop motor through PR5.06. Status: Switch on disable, axis disabled.

1 : Motor decelerates and stops through 609A. Status: Switch on disable, axis disabled.

2 : Motor decelerates and stops through 6085. Status: Switch on disable, axis disabled.

3 : Motor decelerates and stops through 60C6. Status: Switch on disable, axis disabled.

5 : Motor decelerates and stops through 609A. Status: Quick stop

6 : Motor decelerates and stops through 6085. Status: Quick stop

7 : Motor decelerates and stops through 60C6. Status: Quick stop

Index 605Bh	Label	Shutdown Option Code			Mode	F		
	Range	0~1			Default	0	Unit	-
	Structure	VAR	Type	Uint16	Mapping	-	Access	RW

PP, CSP, CSV, PV

0：To stop motor through PR5.06, 5.06 = 0(Emergency stop), 5.06=1(Free stop)

1：Motor decelerates and stops through 6084

HM

0：To stop motor through PR5.06, 5.06 = 0(Emergency stop), 5.06=1(Free stop)

1：Motor decelerates and stops through 609A

CST

0 ：To stop motor through PR5.06, 5.06 = 0(Emergency stop), 5.06=1(Free stop)

1 ：Motor decelerates and stops through 6087

Index 605Ch	Label	Disable Operation Option Code			Mode	F		
	Range	0~1			Default	0	Unit	-
	Structure	VAR	Type	INT16	Mapping	-	Access	RW

To set motor stopping mode when servo drive is disabled.

PP, CSP, CSV, PV

0 ：To stop motor through PR5.06, 5.06 = 0(Emergency stop), 5.06=1(Free stop)

1 ：Motor decelerates and stops through 6084

HM

0 ：To stop motor through PR5.06, 5.06 = 0(Emergency stop), 5.06=1(Free stop)

1 ：Motor decelerates and stops through 609A

CST

0 ：To stop motor through PR5.06, 5.06 = 0(Emergency stop), 5.06=1(Free stop)

1 ：Motor decelerates and stops through 6087

Index 605Dh	Label	Halt Option Code			Mode	F		
	Range	1~3			Default	1	Unit	-
	Structure	VAR	Type	INT16	Mapping	-	Access	RW

When control word is set to halt, set deceleration and stop option. Also suitable for deceleration mode settings during mode switching

PP, CSP, CSV, PV

1 ：Motor decelerates and stops through 6084. Status: Operation enabled, axis enabled.

2 ：Motor decelerates and stops through 6085. Status: Operation enabled, axis enabled.

3 ：Motor decelerates and stops through 60C6. Status: Operation enabled, axis enabled.

HM

1 ：Motor decelerates and stops through 609A. Status: Operation enabled, axis enabled.

2 ：Motor decelerates and stops through 6085. Status: Operation enabled, axis enabled.

3 ：Motor decelerates and stops through 60C6. Status: Operation enabled, axis enabled.

CST

1, 2 ：Motor decelerates and stops through 6087. Status: Operation enabled, axis enabled.

3 ：Motor decelerates and stops through torque = 0. Status: Operation enabled, axis enabled.

Index 605Eh	Label	Fault Reaction Option Code			Mode	F		
	Range	0~2			Default	0	Unit	-
	Structure	VAR	Type	INT16	Mapping	-	Access	RW

Select stopping mode when servo alarm (Err 8xx) occurs.

PP, CSP, CSV, PV

0 ： Select motor stopping mode according to alarm properties. Status: Fault, axis disabled.

1 ： Motor decelerates and stops through 6084. Status: Fault, axis disabled.

2 ： Motor decelerates and stops through 6085. Status: Fault, axis disabled.

HM

0 ： Select motor stop by the alarm attribute for emergency stop, the fault state and disable

1 ： After the 609A motor is decelerated and stopped, the fault state and disable

2 ： After the 6085 motor is decelerated and stopped, the fault state and disable

CST

0, 1 ： Select motor stop by the alarm attribute for emergency stop, the fault state and disable

2 ： After the 6087 motor is decelerated and stopped, the fault state and disable When other alarms, i.e. drive-side alarms:

Select motor stop by the alarm attribute for emergency stop, the fault state and disable

Index 6060h	Label	Mode of Operation			Mode	F

Index 6062h	Label	Position Demand Value			Mode	PP	CSP	HM
	Range	-2147483648~2147483647			Default	0	Unit	*Command*
	Structure	VAR	Type	INT32	Mapping	TPDO	Access	RO
Reflects position command when servo driver is enabled.								

Index 6063h	Label	Position Actual Internal Value			Mode	F		
	Range	-2147483648~2147483647			Default	0	Unit	*Encoder*
	Structure	VAR	Type	INT32	Mapping	TPDO	Access	RO
Reflects motor absolute position (Encoder unit)								

Index 6064h	Label	Position Actual Value			Mode	F		
	Range	-2147483648~2147483647			Default	0	Unit	*Command*
	Structure	VAR	Type	INT32	Mapping	TPDO	Access	RO
Reflects user's real time absolute position 6064h*Gear ratio = 6063h								

Index 6065h	Label	Follow Error Window			Mode	PP	CSP	HM
	Range	0~2147483647			Default	30000	Unit	*Command*
	Structure	VAR	Type	UINT32	Mapping	RPDO	Access	RO
To set an acceptable deviation for requested position. When actual position exceeds position deviation window, error might occur.								

Index 6066h	Label	Follow Error Time Out			Mode	PP	CSP	HM
	Range	0~65535			Default	10	Unit	*Command*
	Structure	VAR	Type	UINT16	Mapping	RPDO	Access	RO
To set position deviation detection time								

Index 6067h	Label	Position window			Mode	PP	CSP	HM
	Range	0~2147483647			Default	10	Unit	*Command*
	Structure	VAR	Type	UINT32	Mapping	RPDO	Access	RO
To set an acceptable extent of arrival position								

Index 6068h	Label	Position window time			Mode	PP	CSP	HM
	Range	0~65535			Default	300	Unit	*Command*
	Structure	VAR	Type	UINT16	Mapping	RPDO	Access	RO
To set the time between arrival to the output of INP (In position) signal.								

Index 606Bh	Label	Velocity Demand Value			Mode	CSV		PV
	Range	-2147483648~2147483647			Default	0	Unit	*Command/s*
	Structure	VAR	Type	INT32	Mapping	TPDO	Access	RO
Show user set velocity demand value.								

Index 606Ch	Label	Velocity Actual Value			Mode	F		
	Range	-2147483648~2147483647			Default	0	Unit	*Command/s*
	Structure	VAR	Type	INT16	Mapping	TPDO	Access	RO
Show actual velocity value.								

Index 606Dh	Label	Velocity window			Mode	CSV		PV
	Range	0~65535			Default	10	Unit	*Command/s*
	Structure	VAR	Type	UINT16	Mapping	RPDO	Access	RO
Set the range of velocity								

Index 606Eh	Label	Velocity window time			Mode	CSV		PV
	Range	0~65535			Default	0	Unit	ms
	Structure	VAR	Type	UINT16	Mapping	RPDO	Access	RO
To set the time between velocity reached and status word set to Target Reached.								

Index 606Fh	Label	Velocity Threshold			Mode	CSV		PV
	Range	0~65535			Default	10	Unit	*Command/s*
	Structure	VAR	Type	UINT16	Mapping	RPDO	Access	RO
To set to zero-speed range.								

Index 6070h	Label	Velocity Threshold Time			Mode	CSV		PV
	Range	0~65535			Default	100	Unit	ms
	Structure	VAR	Type	UINT16	Mapping	RPDO	Access	RO
To set the time until status word – zero speed detection is canceled.								

Index 6071h	Label	Target torque			Mode	CST		PT
	Range	-32768~32767			Default	100	Unit	0.1%
	Structure	VAR	Type	INT16	Mapping	RPDO	Access	RW
To set target torque for profile and cyclic torque mode.								

Index 6072h	Label	Maximum torque			Mode	F		
	Range	0~65535			Default	3000	Unit	0.1%
	Structure	VAR	Type	UINT16	Mapping	RPDO	Access	RW
To set max torque for servo drive, limited by motor's highest torque.								

Index 6073h	Label	Maximum current			Mode	F		
	Range	0~65535			Default	3000	Unit	0.1%
	Structure	VAR	Type	UINT16	Mapping	TPDO	Access	RO
To set max. current for servo driver.								

Index 6074h	Label	Torque Demand			Mode	F		
	Range	-32768~32767			Default	0	Unit	0.1%
	Structure	VAR	Type	INT16	Mapping	TPDO	Access	RO
Internal command torque								

Index 6075h	Label	Motor Rated Current			Mode	F		
	Range	0~2147483647			Default	3000	Unit	mA
	Structure	VAR	Type	INT32	Mapping	TPDO	Access	RO
Shows motor rated current.								

Index 6076h	Label	Motor Rated Torque			Mode	F		
	Range	0~2147483647			Default	3000	Unit	mN.m
	Structure	VAR	Type	INT32	Mapping	TPDO	Access	RO
Shows motor rated torque.								

Index 6077h	Label	Torque Actual Value			Mode	F		
	Range	-32768~32767			Default	0	Unit	0.1%
	Structure	VAR	Type	INT16	Mapping	TPDO	Access	RO
Shows servo driver actual torque feedback								

Index 6078h	Label	Current Actual Value			Mode	F		
	Range	-32768~32767			Default	0	Unit	0.1%
	Structure	VAR	Type	INT16	Mapping	TPDO	Access	RO
Shows servo drive actual current value								

Index 6079h	Label	DC Link Circuit Voltage			Mode	F		
	Range	0~2147483647			Default	0	Unit	mV
	Structure	VAR	Type	UINT32	Mapping	TPDO	Access	RO
Shows DC bus voltage across P, N terminals								

Index 607Ah	Label	Target position			Mode	PP		CSP
	Range	-2147483647~2147483647			Default	0	Unit	*command*
	Structure	VAR	Type	INT32	Mapping	RPDO	Access	RW
To set the target position under profile and cyclic position mode.								

Index 607Ch	Label	Home Offset			Mode	HM		
	Range	-2147483647~2147483647			Default	0	Unit	*command*
	Structure	VAR	Type	INT32	Mapping	RPDO	Access	RW
To set position offset to compensate for the deviation of mechanical origin from motor origin under homing								

Index 607Dh-01	Label	Min Position Limit			Mode	PP		CSP
	Range	-2147483647~2147483647			Default	0	Unit	*command*
	Structure	VAR	Type	INT32	Mapping	RPDO	Access	RW
To set lower limit with calculated position and actual position using absolute position after homing.								

Index 607Dh-01	Label	Max Position Limit			Mode	PP		CSP
	Range	-2147483647~2147483647			Default	0	Unit	*command*
	Structure	VAR	Type	INT32	Mapping	RPDO	Access	RW
To set upper limit with calculated position and actual position using absolute position after homing.								

Index 607Eh	Label	Polarity			Mode	F		
	Range	0x0 – 0xFF			Default	0x0	Unit	*command*
	Structure	VAR	Type	UINT8	Mapping	RPDO	Access	RW

Set input polarity of the command.

Mode		Set Value
Position mode	PP	0：Rotate in the same direction as the position command 128：Rotate in the opposite direction to the position command
	HM	
	CSP	
Velocity mode	PV	0：Rotate in the same direction as the position command 64：Rotate in the opposite direction to the position command
	CSV	
Torque mode	PT	0：Rotate in the same direction as the position command 32：Rotate in the opposite direction to the position command
	CST	
ALL mode		0：Rotate in the same direction as the position command 224：Rotate in the opposite direction to the position command

Index 607Fh	Label	Max Profile Velocity			Mode	PP	HM	PV	CST
	Range	0~2147483647			Default	2147483647	Unit	*Command/s*	
	Structure	VAR	Type	UINT32	Mapping	RPDO	Access	RW	
To set max allowable velocity. Limited by 6080									

Index 6080h	Label	Max Motor Speed			Mode	F		
	Range	0~2147483647			Default	6000	Unit	r/min
	Structure	VAR	Type	UINT32	Mapping	RPDO	Access	RW
To set the maximum allowable motor velocity.								

Index 6081h	Label	Profile velocity			Mode	PP		
	Range	0~2147483647			Default	10000	Unit	*Command/s*
	Structure	VAR	Type	UINT32	Mapping	RPDO	Access	RW
To set target velocity. Limited by 607Fh.

To set motor acceleration								

Index 6084h	Label	Profile deceleration			Mode	PP		PV
	Range	1~2147483647			Default	10000	Unit	*command/s²*
	Structure	VAR	Type	UINT32	Mapping	RPDO	Access	RW
To set motor deceleration								

Index 6085h	Label	Quick Stop Deceleration			Mode	CSP	CSV	PP	PV	HM
	Range	1~2147483647			Default	10000000	Unit		*command/s²*	
	Structure	VAR	Type	UINT32	Mapping	RPDO	Access		RW	
To set the deceleration during an emergency stop										

Index 6087h	Label	Torque slope			Mode	PT		
	Range	1~2147483647			Default	5000	Unit	0.1%/s
	Structure	VAR	Type	UINT32	Mapping	RPDO	Access	RW
To set values for tendency torque command								

Index 608Fh-01	Label	Encoder Increments			Mode	PT		
	Range	0~2147483647			Default	0	Unit	*encoder*
	Structure	VAR	Type	UINT32	Mapping	TPDO	Access	RO
To set encoder resolution								

Index 6091h-01	Label	Motor Revolutions			Mode	F		
	Range	1~2147483647			Default	1	Unit	r
	Structure	VAR	Type	UINT32	Mapping	RPDO	Access	RW
To set electronic gear ratio numerator								
Index 6091h-02	**Label**	Shaft Revolutions			**Mode**	**F**		
	Range	1~2147483647			**Default**	1	**Unit**	r
	Structure	VAR	**Type**	UINT32	**Mapping**	RPDO	**Access**	RW
To set electronic gear ratio denominator								
Index 6092h-01	**Label**	Feed			**Mode**	**F**		
	Range	1~2147483647			**Default**	10000	**Unit**	*Command/r*
	Structure	VAR	**Type**	UINT32	**Mapping**	RPDO	**Access**	RW
If 6092h-01(Feed constant) is not equal to 608Fh (Position encoder resolution), then: Electronic gear ratio = Encoder increments / 6092h-01 If 6092h-01(Feed constant) is equal to 608Fh (Position encoder resolution), then: Electronic gear ratio = 6091-01 / 6092h-01								

Index 6098h	Label	Homing method			Mode	HM		
	Range	-6 ~ 37			Default	19	Unit	-
	Structure	VAR	Type	UINT8	Mapping	RPDO	Access	RW

The table below describes the velocity, direction and stopping conditions of each homing methods.

Value	Description		
	Velocity	Direction	Stop
-6	Low	Negative	When torque reached
-5	Low	Positive	When torque reached
-4	High	Negative	Inversed when torque reached, after torque is gone
-3	High	Positive	Inversed when torque reached, after torque is gone
-2	High	Negative	Inversed when torque reached, received 1st Z-signal after torque is gone
-1	High	Positive	Inversed when torque reached, received 1st Z-signal after torque is gone

	Direction	Deceleration point	Home	Before Z-signal
1	Negative	Negative limit switch	Motor Z-signal	Negative limit switch falling edge
2	Positive	Positive limit switch	Motor Z-signal	Positive limit switch falling edge
3	Positive	Homing switch	Motor Z-signal	Falling edge on same side of homing switch
4	Positive	Homing switch	Motor Z-signal	Rising edge on same side of homing switch
5	Negative	Homing switch	Motor Z-signal	Falling edge on same side of homing switch
6	Negative	Homing switch	Motor Z-signal	Rising edge on same side of homing switch
7	Positive	Homing switch	Motor Z-signal	Falling edge on same side of homing switch
8	Positive	Homing switch	Motor Z-signal	Rising edge on same side of homing switch
9	Positive	Homing switch	Motor Z-signal	Rising edge on same side of homing switch
10	Positive	Homing switch	Motor Z-signal	Falling edge on same side of homing switch
11	Negative	Homing switch	Motor Z-signal	Falling edge on same side of homing switch
12	Negative	Homing switch	Motor Z-signal	Rising edge on same side of homing switch
13	Negative	Homing switch	Motor Z-signal on other side of homing switch	Rising edge on other side of homing switch
14	Negative	Homing switch	Motor Z-signal on other side of homing switch	Falling edge on other side of homing switch
15				
16				
17-32	Similar with 1-14, but deceleration point = homing point			
33	Home in negative direction, homing point = motor Z-signal			
34	Home in positive direction, homing point = motor Z-signal			
35-37	Set current position as homing point			

Index 6099h-01	Label	Speed During Search for Switch			Mode	HM		
	Range	0~2147483647			Default	10000	Unit	*Command/s*

Chapter 4 Servo Drive Operation

4.1 Get Started with Driver Operation

4.1.1 Checklist before operation

No.	Description
Power supply	
1	The voltage of main and control circuit power supply is within rated values.
2	Power supply polarity is rightly connected.
Wiring	
1	Power supply input is rightly connected.
2	Driver's power output UVW matches UVW terminals on the main circuit.
3	No short circuit of driver's input and output UVW terminals.
4	Signal cables are correctly and well connected.
5	Drivers and motors are connected to ground
6	All cables under stress within recommended range.
7	No foreign conductive objects inside/outside the driver.
Mechanical	
1	Driver and external holding brake are not place near combustibles.
2	Installations of driver, motor and axis is fastened.
3	Movement of motors and mechanical axes are not obstructed.

4.1.2 Power On

Connect 400V power supply into main power supply R, S, T terminals and 220V power supply into control circuit power supply L1C, L2C. After power on, light indicator will light up and front Panel will display rEAdy, then LED initial status will be displayed. Driver is ready for operation if no alarm occurs.

4.1.3 Trial Run

Servo drive must be disabled before performing trial run. For safety precautions, please JOG under minimal velocity.

Related Parameter s

No.	Parameter s	Label	Set value	Unit
1	PR0.01	Control mode settings	9	/
2	PR6.04	JOG trial run command velocity	User defined	r/min
3	PR6.25	Trial run acc-/deceleration time	User defined	ms/1000rpm

Please make sure the mechanical axis is within the range of motion and travelled distance should not be too long to avoid collision.

- *Set optimal velocity and acceleration for trial run (not too high!)*

Do not modify any gain related Parameter s during motion to avoid vibration.

Please refer to "AF Jog Trial Run" for detailed explanations on how to perform trial run using front Panel operation

4.1.4 Motor rotational direction settings

Motor rotational direction can be changed through PR0.06 without changing the polarity of the input command.

PR0.06	Label	Command polarity inversion	Mode	F		
	Range	0 ~ 1	Default	0	Unit	—
	Activation	After restart			Index	2006h
Used to change the rotational direction of the motor						

Set value	Details
0	Polarity of the command is not inversed. The direction of rotation is consistent with the polarity of command.
1	Polarity of command is inversed. The direction of rotation is opposite to the polarity of command.

Note: Rotational direction of the motor is recommended to be set through object dictionary 607E. However, PR0.06 has higher priority than object dictionary 607E. 607E only takes effect when PR0.06 = 0.

4.1.5 Holding Brake Settings

Holding brake is designed to hold the axis in position to prevent it from sliding due to applied external forces when the driver is disabled. Holding brake is optional and depends on the model of motor chosen for the application.

Please only use holding brake when motor is stopped. No applicable when motor is in motion.

- *Holding brake coil has no polarity.*

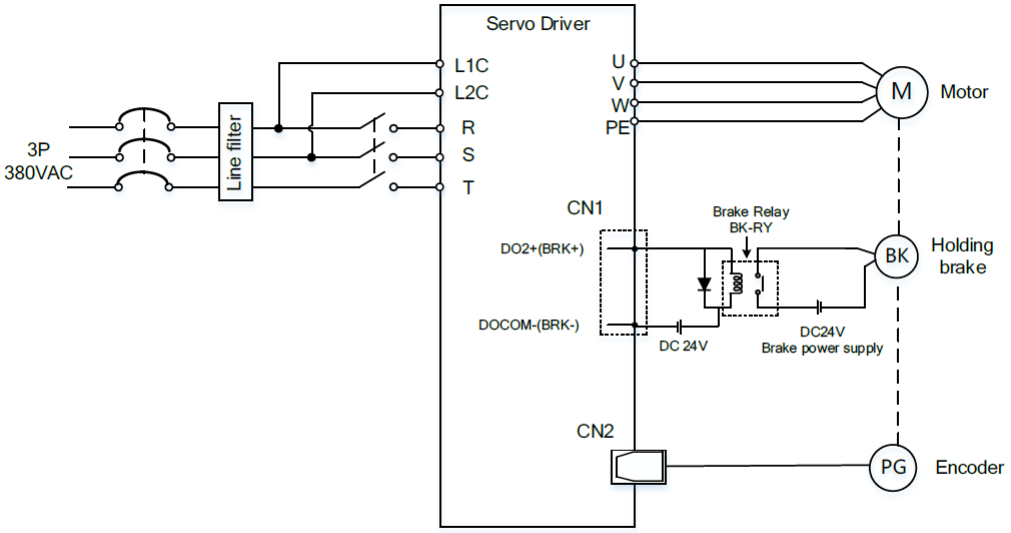
Motor should be disabled after stopped.

- *There is some noise when motors with brake are in motion but that doesn't affect its functionality.*

Magnetic sensors might be affected when the holding brake is on. Please be aware.

Holding brake wiring

Holding brake input signal is without polarity. An isolated 24V switching power supply is recommended to prevent abnormal holding brake behavior in case of sudden drop in working current or voltage.



Wiring diagram of motor holding brake

4.1.6 Servo Running

1. Enable servo driver

Check if CN3/CN4 is connected properly. Servo driver is in ready mode. Motor is stopped and holding brake is activated. Front Panel display shows 402 state machine = Operational, EtherCAT communication status = operational, Running mode = 8, servo is in stop mode.

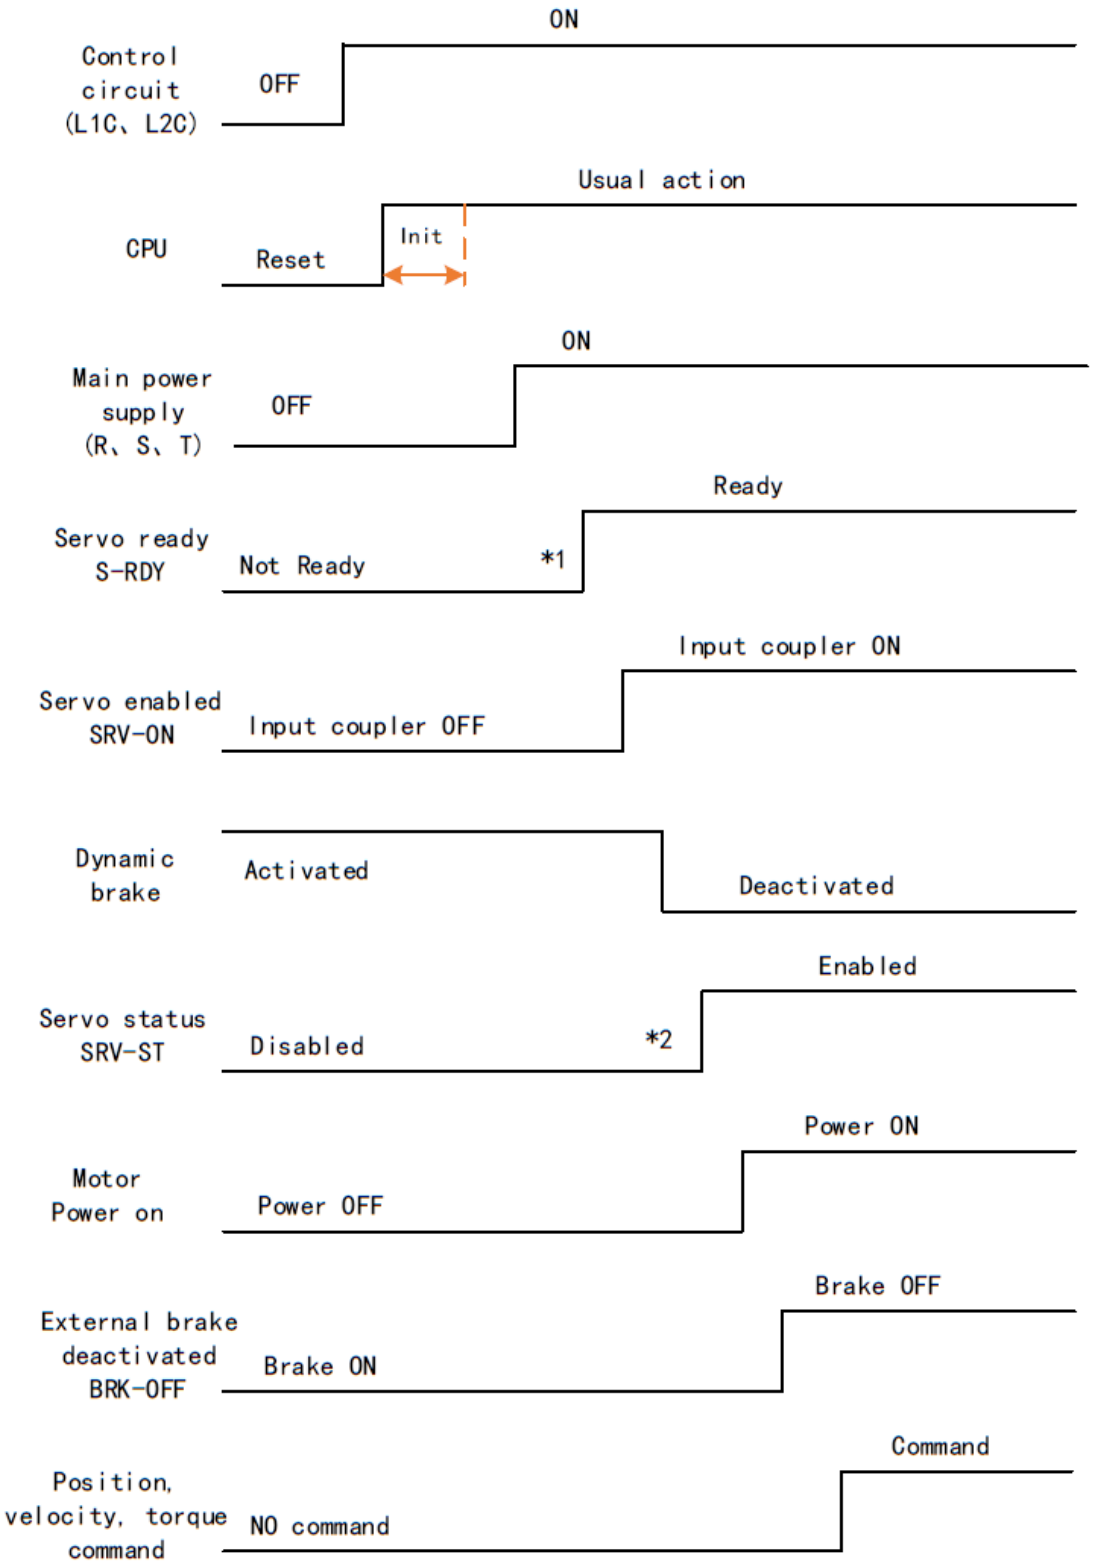
2. Motor starts to move after command input

i. On first time operation, please use suitable command at low velocity. Confirm if motor is working normally.

ii. Check if motor rotational direction is correct. If not, please check input command or Parameter settings. (Pr0.06).

iii. If motor is working normally, motion data such as motor rotational velocity “d01SP” and actual torque feedback “d04tr” can be monitored on the front Panel or through Optimus Tuning Software.

3. Power on sequence diagram



Please enter servo status, position, velocity, torque command as sequence diagram above.

** 1. S-RDY signal is given after CPU initialization and main power supply powered on.

2. SRV-ST signal is received when servo driver is enabled. Command input is not allowed yet.

4.1.7 Servo stop

Servo stopping are of 3 different methods: Servo braking method, free stopping method, dynamic braking method.

Stopping method	Description	Details
Servo braking	Servo driver delivers braking torque in opposite direction	Quick stopping but mechanical impact might exist
Free stopping	Motor power cut off. Free to move until velocity = 0. Affected inertia, friction and other factors	Smooth deceleration, low mechanical impact but slow stopping
Dynamic braking	Brake activated when in motion	Quick stopping but mechanical impact might exist

Stopping status	Status after stopped
Free moving	Motor is powered off; rotor is free to rotate
Dynamic braking	Motor is powered off; rotor is not free to rotate
Holding brake stopping	Motor axis is locked, cannot rotate freely

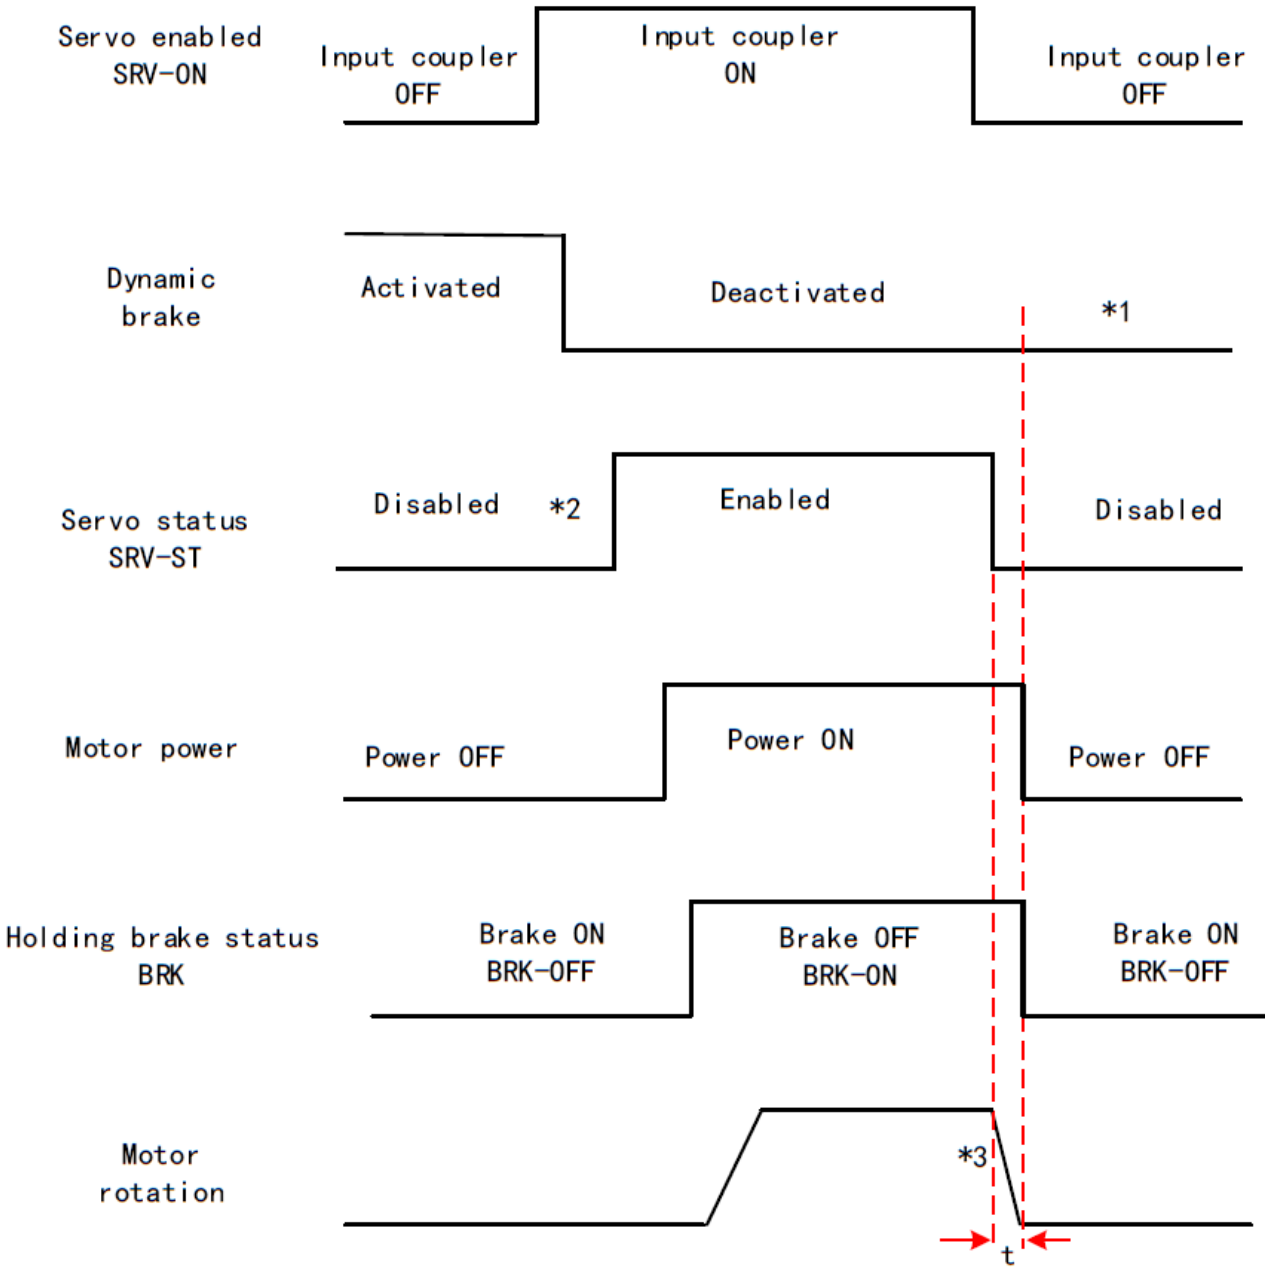
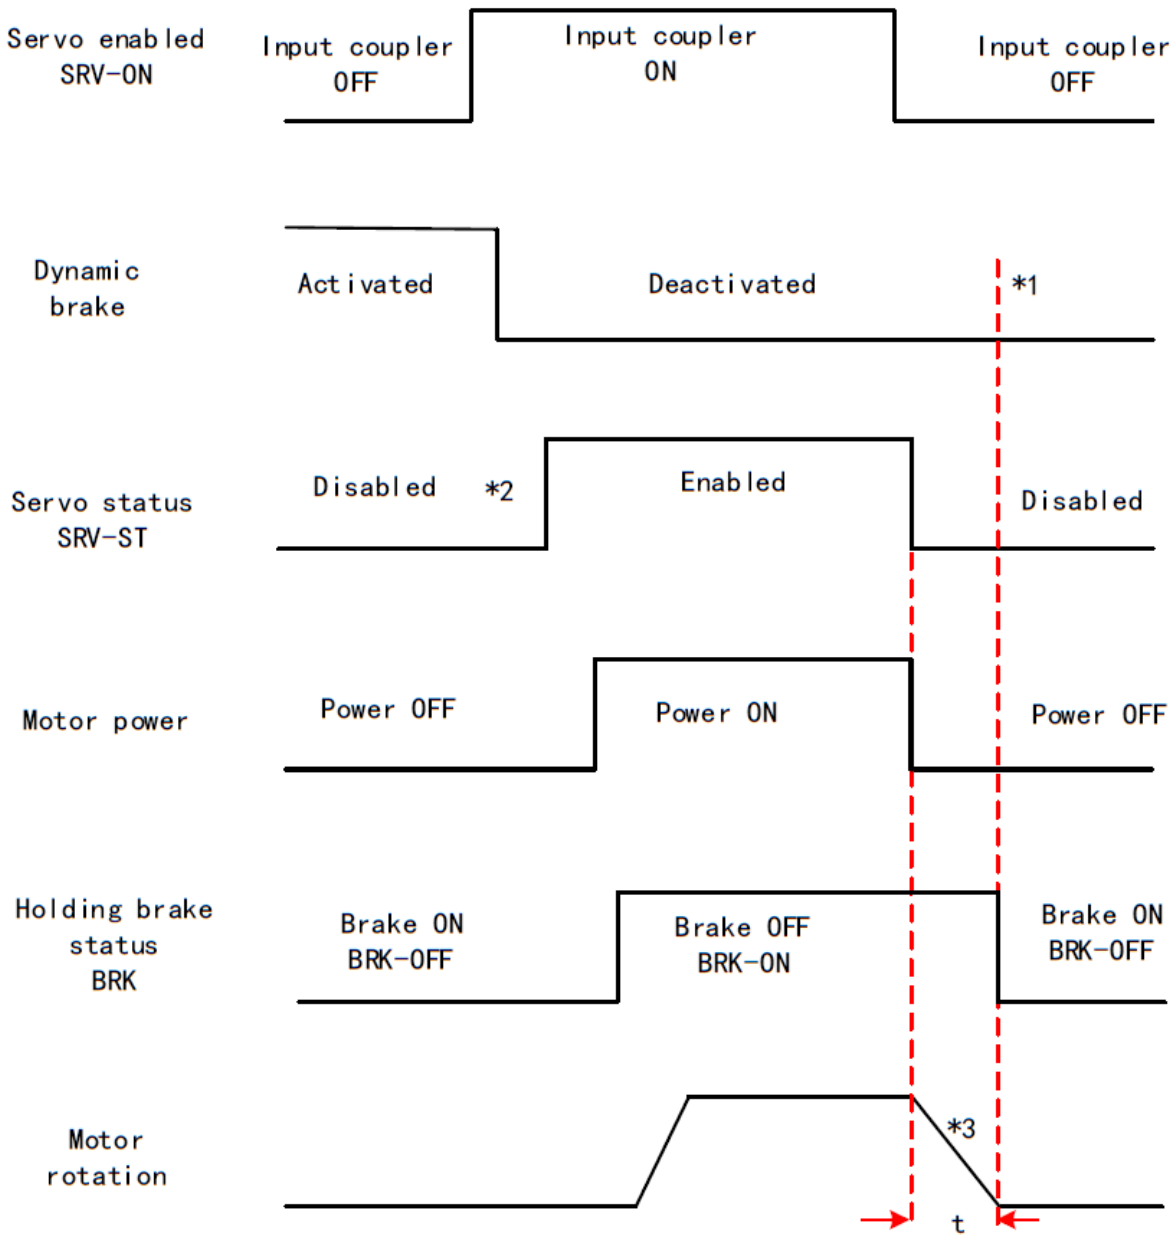
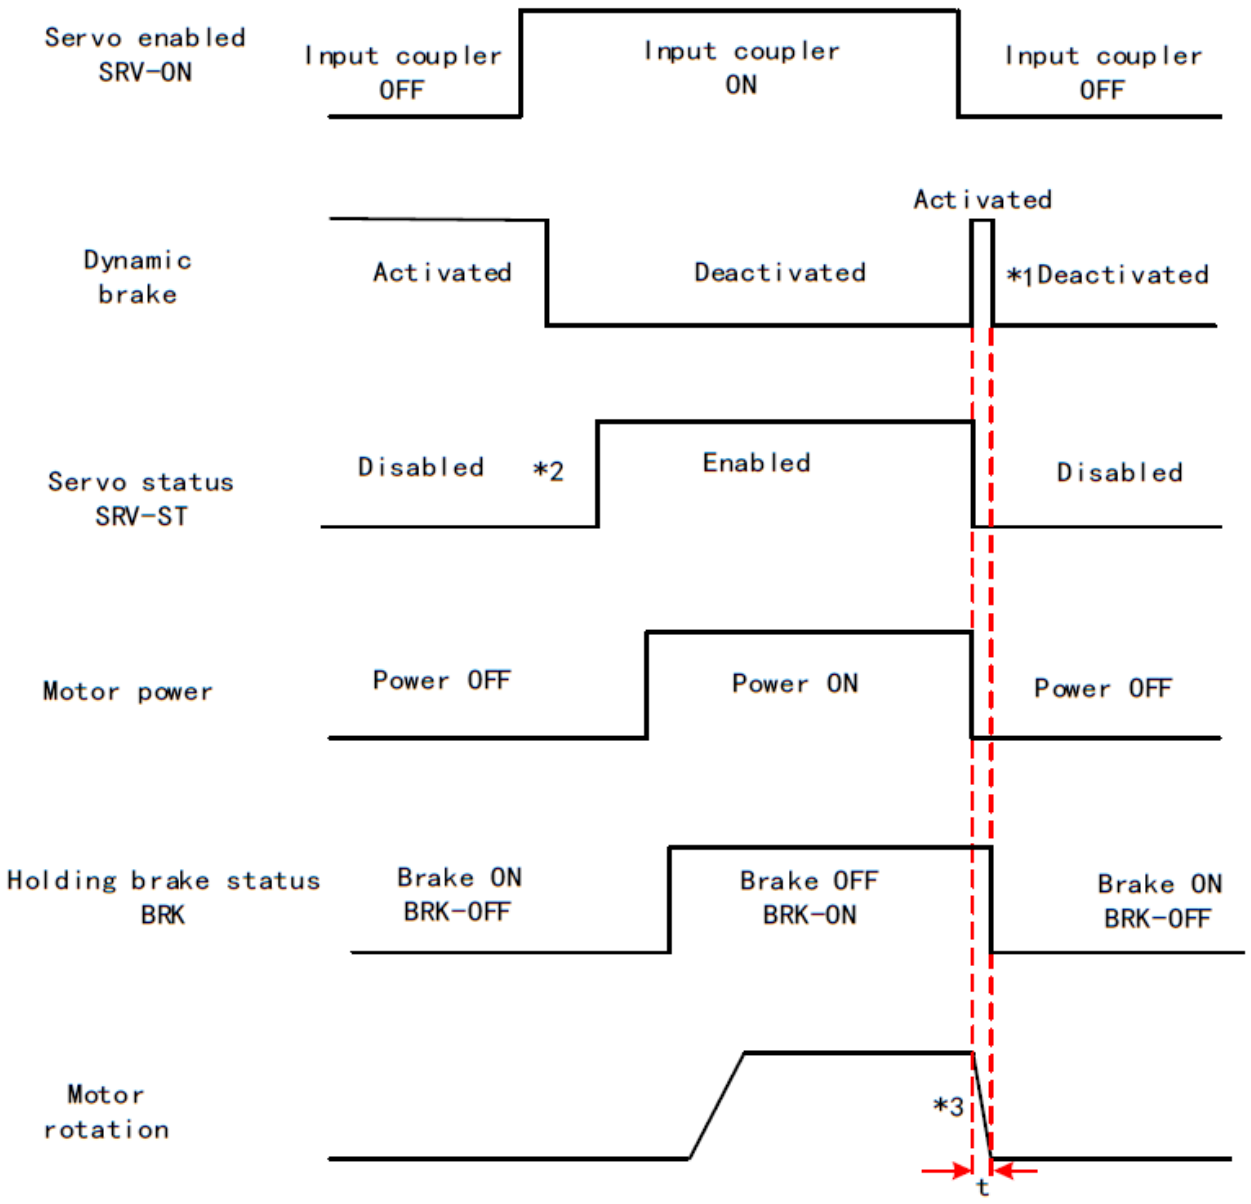
Servo stopping method. Status after stopping: free moving



Free stopping method. Status after stopping: Free moving



Dynamic braking method. Status after stopping: Free moving



** 1. Status after stopping is as defined in PA5.06.

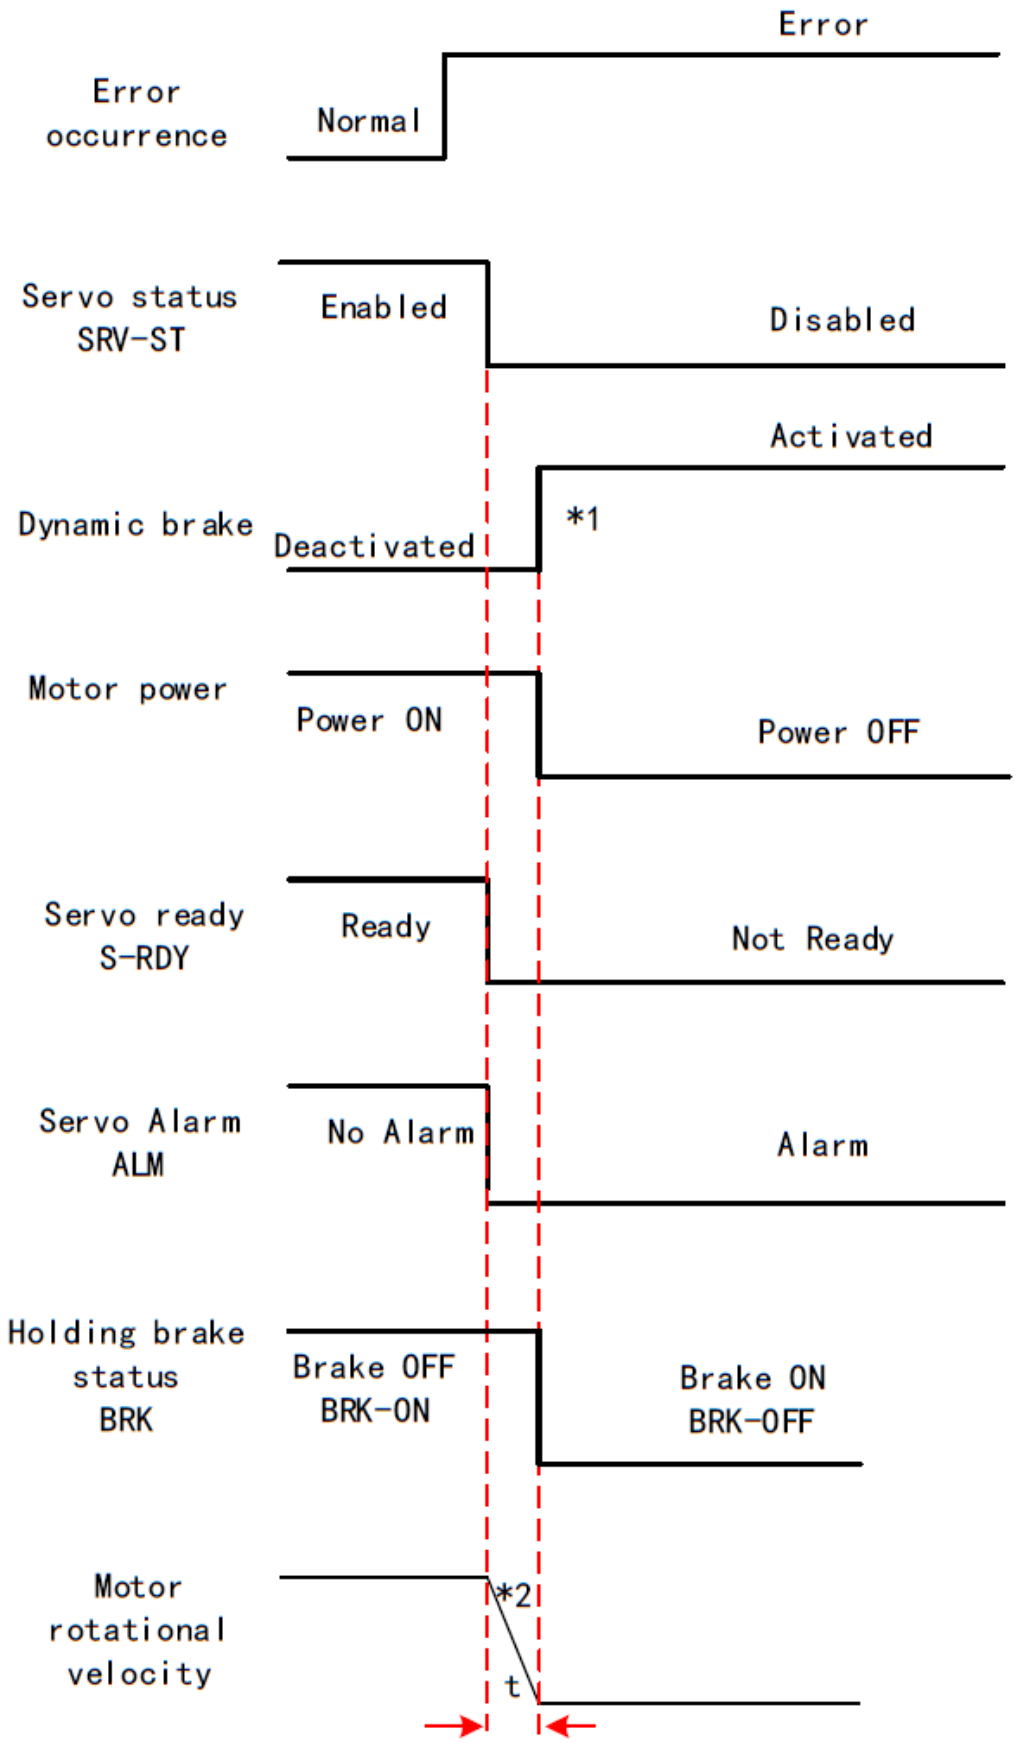
2. SRV-ST signal is received when servo driver is enabled. Command input is not allowed yet.

3. Servo stopping method is as defined in PA5.06; braking torque in opposite direction to decelerate the motor is as defined in PA5.11. Deceleration time t is determined by whichever comes first between time set in PA6.14 and time needed for motor to drop below velocity set in PA4.39. After deceleration time t, dynamic braking will be off and holding brake signal will be set to OFF (Holding brake is activated. Although BRK-OFF signal is valid, actual activation of holding brake is dependent on whether the motor comes with holding brake).

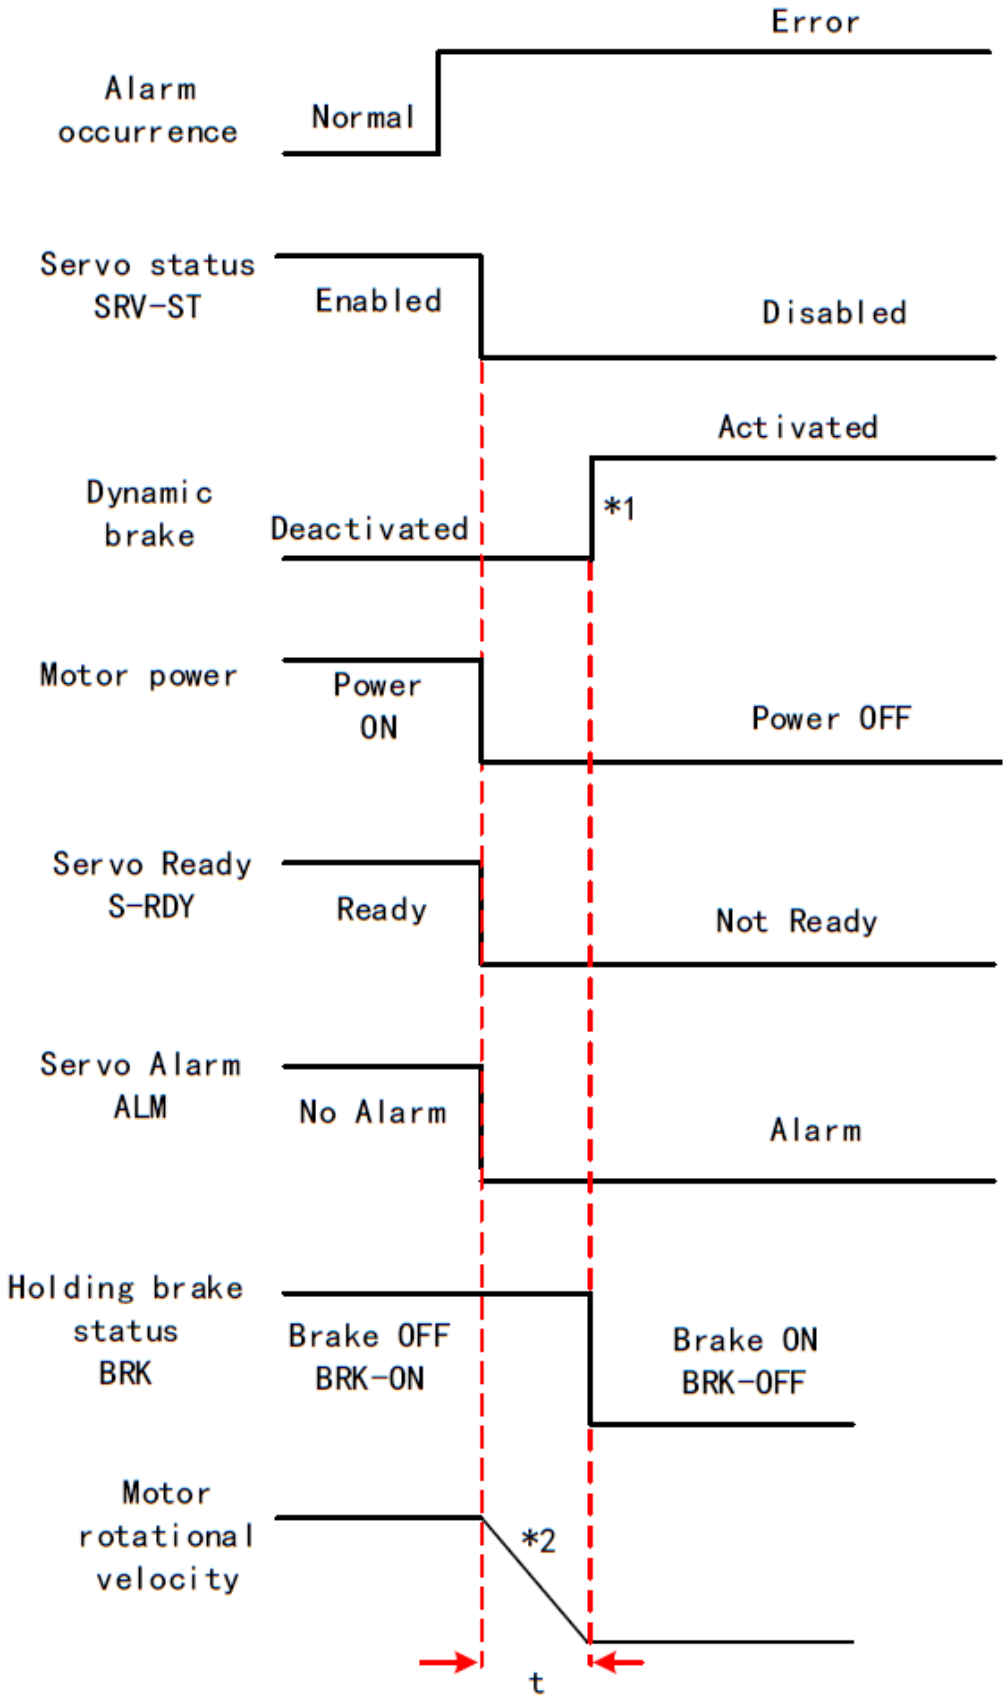
4. BRK-ON signal doesn't indicate the activation of holding brake but the validation of the signal. Holding brake is not applied when BRK-ON signal is valid. Same idea goes for BRK-OFF signal.

Stopping when alarm occurs – Sequence Diagram

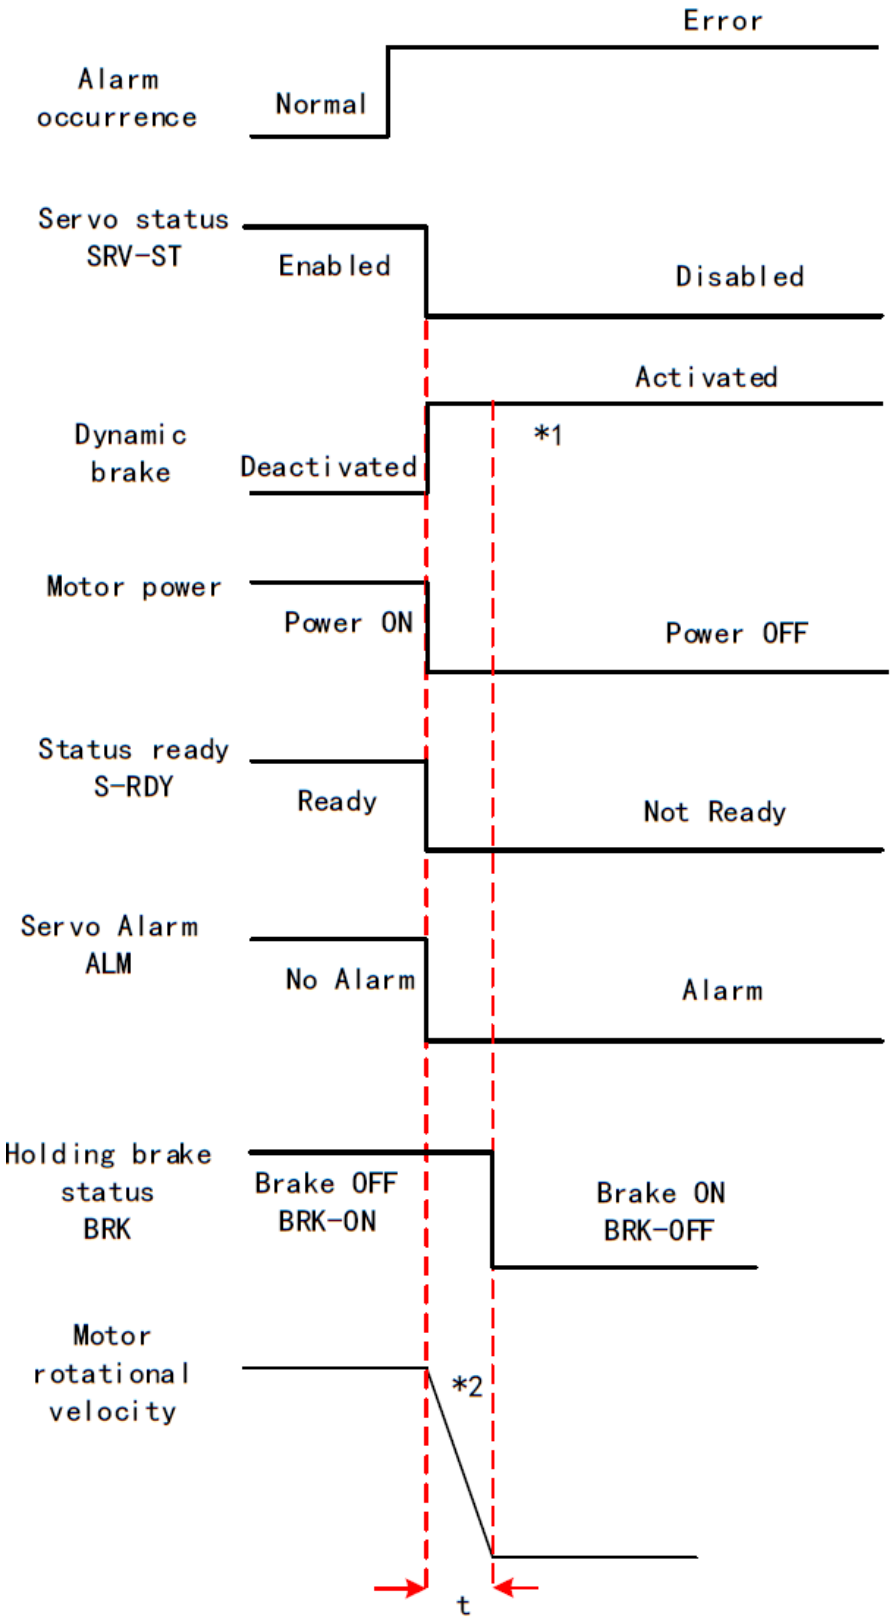
Servo braking method. Status after stopping: Dynamic braking



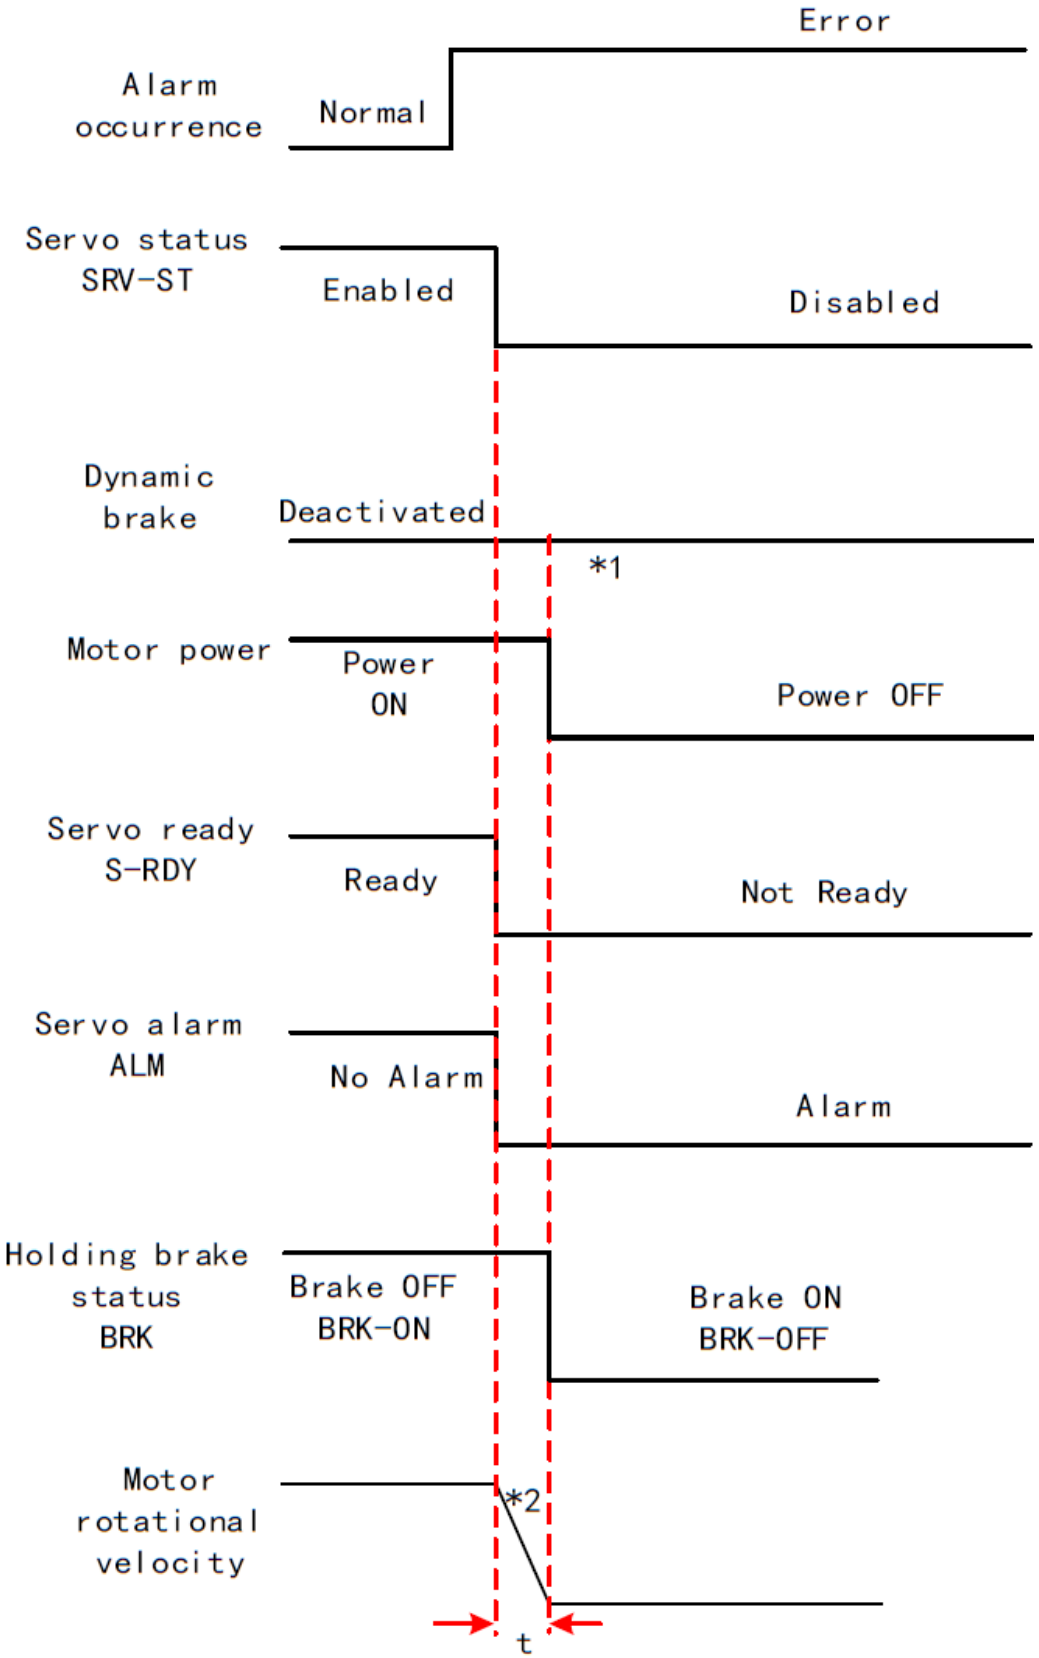
Free stopping method. Status after stopping: Dynamic braking



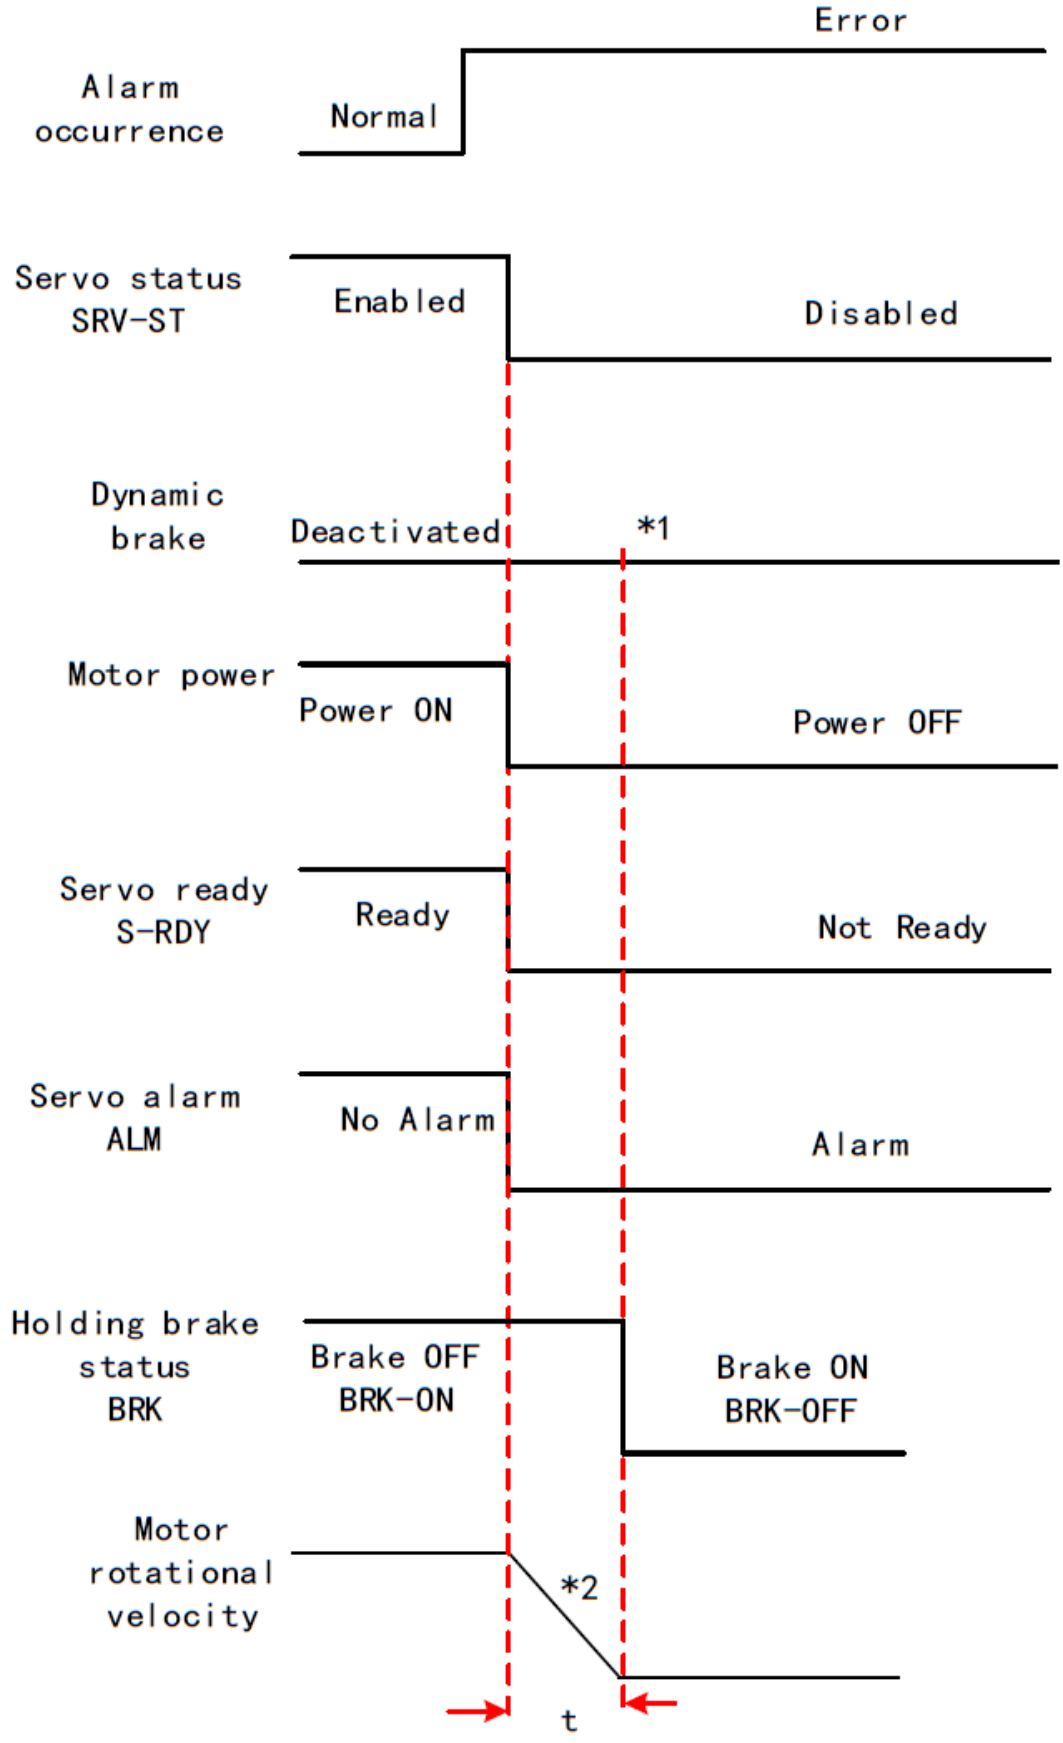
Dynamic braking method. Status after stopping: Dynamic braking



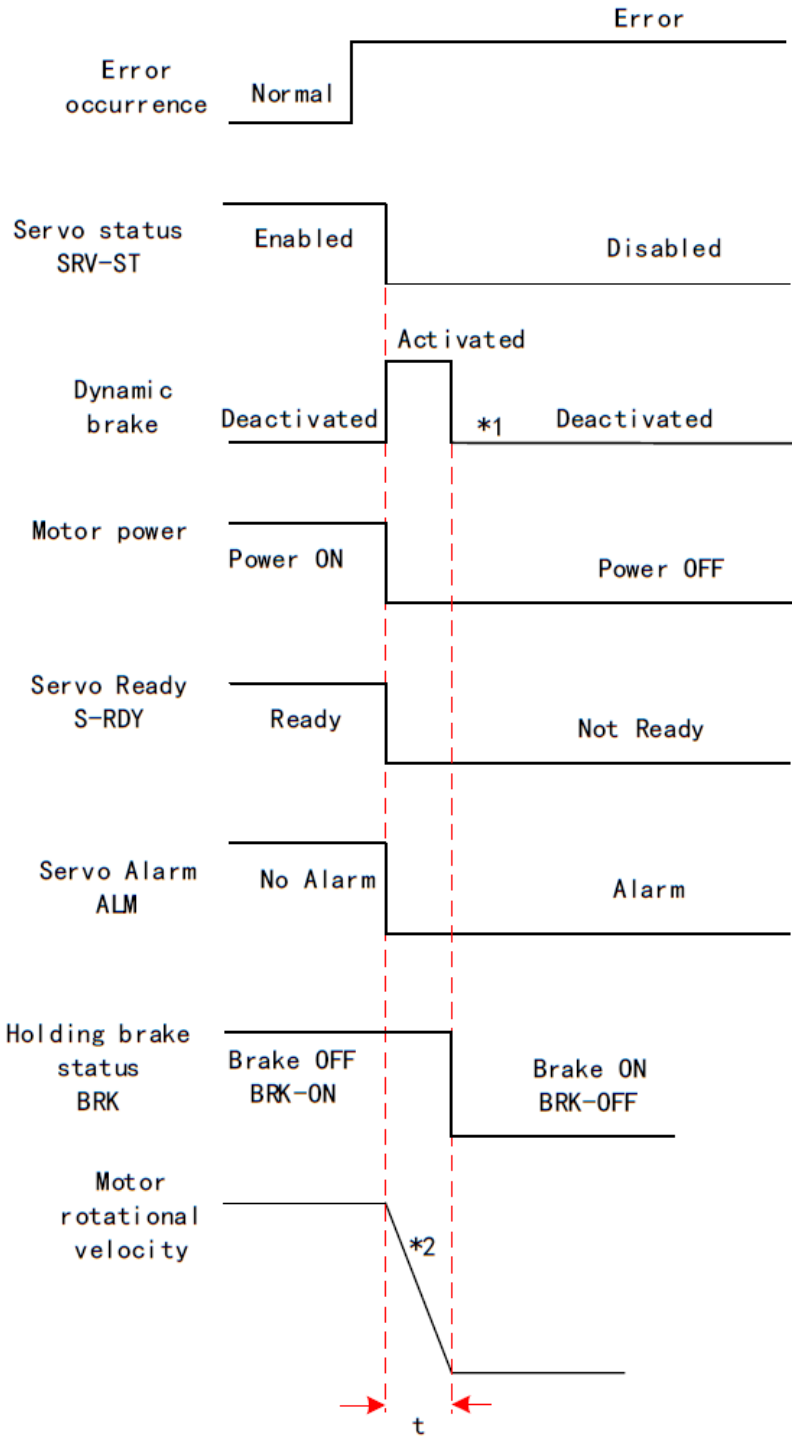
Servo braking method. Status after stopping: Free moving



Free stopping method. Status after stopping: Free moving



Dynamic braking. Status after stopping: Free moving

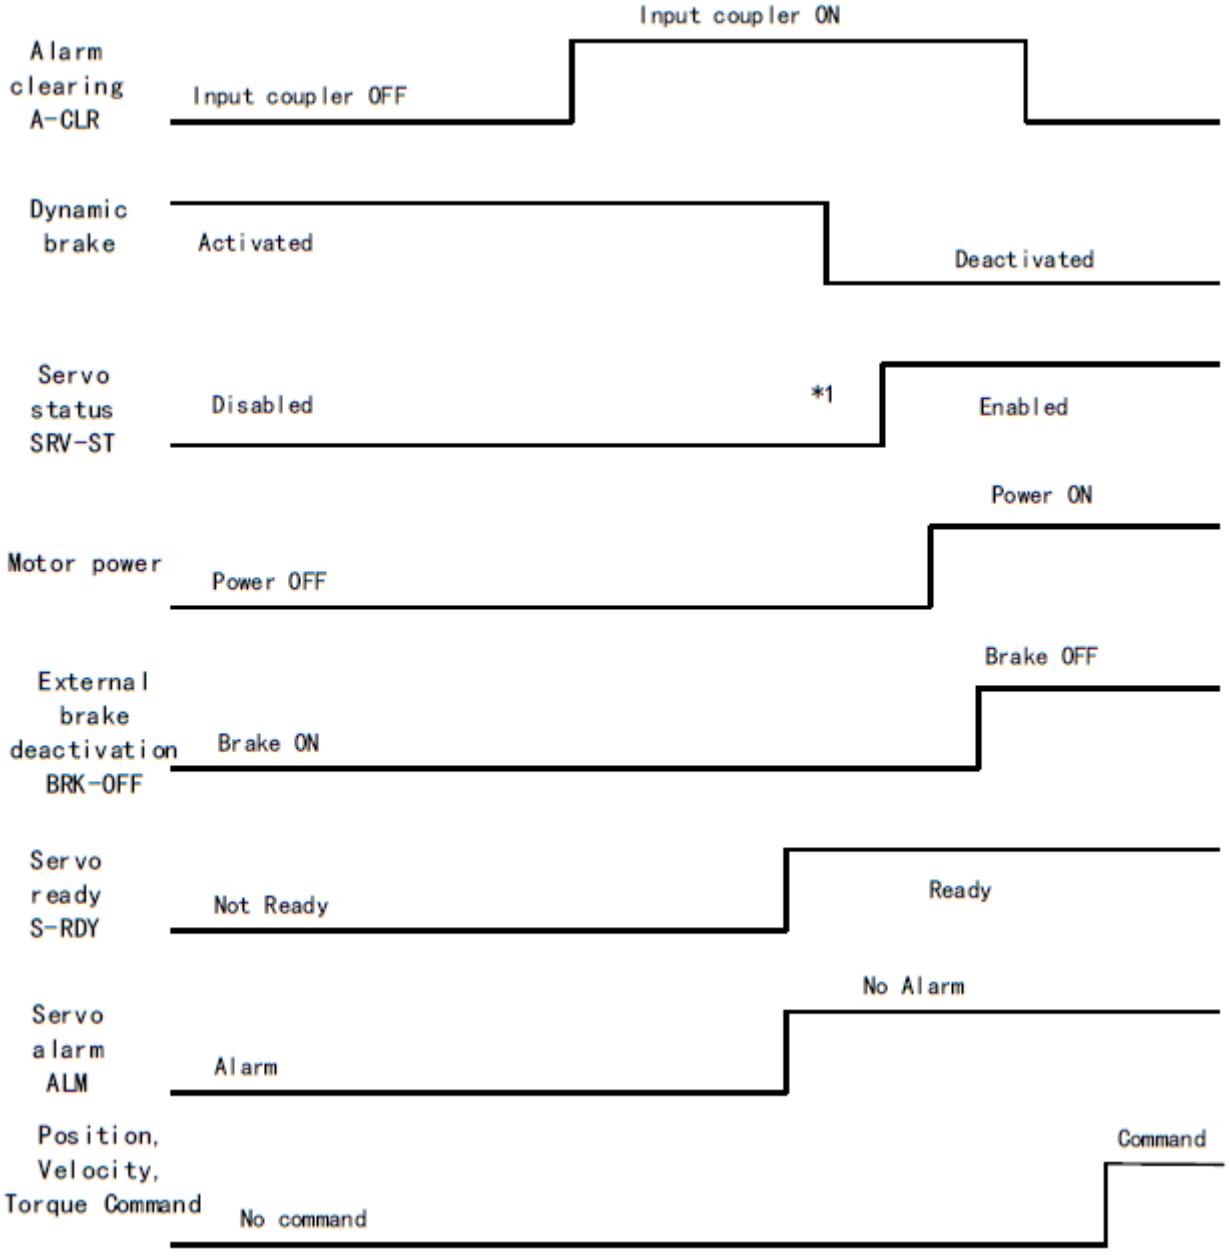


** 1. Status after stopping is as defined in Pr5.10.

2. Servo stopping method is as defined in Pr5.10. Deceleration time t is determined by whichever comes first between time set in Pr6.14 and time needed for motor to drop below velocity set in Pr4.39. After deceleration time t, dynamic braking will be off and holding brake signal will be set to OFF (Holding brake is activated. Although BRK-OFF signal is valid, actual activation of holding brake is dependent on whether the motor comes with holding brake).

3. BRK-ON signal doesn't indicate the activation of holding brake but the invalidation of the signal. Holding brake is not applied when BRK-ON signal is valid. Same idea goes for BRK-OFF signal.

Alarm clearing - Sequence diagram



** 1.SRV-ST signal is received when servo driver is enabled. Command input is not allowed yet 1

2. BRK-OFF signal doesn’t indicate the deactivation of holding brake but the invalidation of the signal. Holding brake is applied when BRK-OFF signal is invalid

4.2 Electronic gear ratio

When loaded axis moved for 1 command unit, it corresponds to motor encoder unit which is converted in more comprehensible physical units such as µm. The use of electronic gear ratio is to turn the movement in physical units to required pulse countequivalency.

$$\text{Electronic gear ratio} = \frac{\text{Rotor movement (Encoder unit)}}{\text{Loaded axis movement(Command unit)}}$$

Rotor might be connected to load through reducer or other mechanical structures. Hence, the gear ratio is closely related to reducer gear ratio, position encoder resolution and mechanical dimensions related Parameters.

$$\text{Electronic gear ratio} = \frac{\text{Encoder resolution}}{\text{Loaded axis resolution}}$$

Electronic gear can be set through Pr0.08. If Pr0.08 ≠ 0, Pr0.08 is valid. If Pr0.08 = 0, object dictionary 6092-01 is valid.

Command pulse count per motor revolution needs to be ? Encoder Pulse Count per Revolution / 8000.

OSD-H-*-E series comes with motors with 23-bit encoder. Pulse count per revolution for 23-bit encoder = 8388608. From the condition above, the command pulse count per motor revolution for 23-bit encoder ≥ 1049.

PR0.08	**Label**	Command pulse count per revolution			**Mode**	**F**		
	Range	0~8388608			**Default**	0	**Unit**	P-
	Activation	After restart					**Index**	2008h
Pulses per revolution can be set using object dictionary 608F, 6091, 6092. However, PR0.08 has higher priority.								
Index 608Fh-01	**Label**	Encoder Increments			**Mode**	**PT**		
	Range	0~2147483647			**Default**	0	**Unit**	*encoder*
	Structure	VAR	**Type**	UINT32	**Mapping**	TPDO	**Access**	RO
To set encoder resolution								
Index 6091h-01	**Label**	Motor Revolutions			**Mode**	**F**		
	Range	1~2147483647			**Default**	1	**Unit**	r
	Structure	VAR	**Type**	UINT32	**Mapping**	RPDO	**Access**	RW
To set electronic gear ratio numerator								
Index 6091h-02	**Label**	Shaft Revolutions			**Mode**	**F**		
	Range	1~2147483647			**Default**	1	**Unit**	r
	Structure	VAR	**Type**	UINT32	**Mapping**	RPDO	**Access**	RW
To set electronic gear ratio denominator								
Index 6092h-01	**Label**	Feed			**Mode**	**F**		
	Range	1~2147483647			**Default**	10000	**Unit**	*Command/r*
	Structure	VAR	**Type**	UINT32	**Mapping**	RPDO	**Access**	RW
If 6092h-01(Feed constant) is not equal to 608Fh(Position encoder resolution), then: Electronic gear ratio = Encoder increments / 6092h-01 If 6092h-01(Feed constant) is equal to 608Fh (Position encoder resolution), then: Electronic gear ratio = 6091-01 / 6092h-01								

4.3 Front Panel

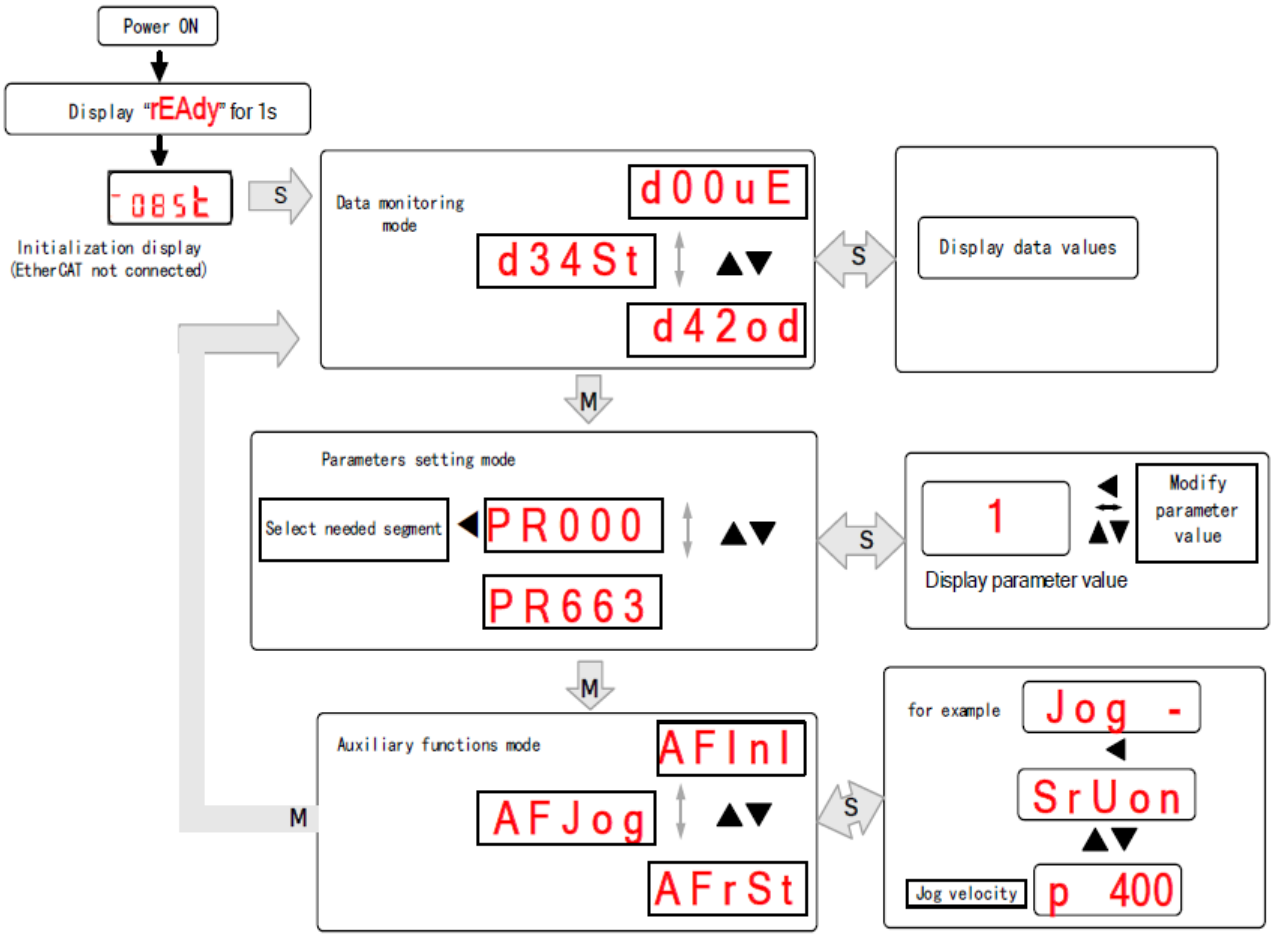
Servo Driver front Panel consists of 5 push buttons and an 8-segments display. Can be used for displaying of status, alarms, functions, Parameter s setting and auxiliary functions.

Front Panel Buttons and functions

Label	Symbol	Function
Display	/	Consists of 5 push buttons and an 8-segments display
Mode	M	To switch between 4 modes: 1. Data monitoring mode : To monitor changes of motion data valu 2. Parameter s setting mode : To set Parameter s 3. Auxiliary functions mode: To operate common functions, such a trial run, alarm clearing
Enter	S	To enter or confirm
Up	▲	To switch between sub-menus / Increase
Down	▼	To switch between sub-menus / Decrease
Left	◄	To switch between values

4.4 Panel Display and Operation

4.4.1 Panel Operation



Flow diagram of Panel operation

(1) rEAdY will be displayed for about 1 second after driver is powered on. Then, automatically enters data monitoring mode and displays initial data value. Otherwise, alarm code will be displayed if error occurs.

(2) Press M key to switch between modes.

Data monitoring mode → Parameter s setting mode → Auxiliary functions mode

Alarm code will be displayed regardless of any mode if alarm occurs. Press M to switch to other modes.

(3) Press ▲or ▼ to select the type of Parameter s in data monitoring mode. Press S to confirm.

(4) Press ◄ to select current segment in Parameter s settings mode. Press ▲ or ▼ to increase/decrease the value of segment. Press S to confirm the modified value(s) and save the Parameter s.

4.4.2 Data Monitoring Mode

OSD-H series servo driver offers the function to monitor different types of data in data monitoring mode. After entering this mode, press S to monitor any data that starts with d. Press S again to get back to data monitoring mode and M to switch to any other modes.

Data list in data monitoring mode

No.	Label	Descriptions	Display	Unit	Data Format (x = numerical value)
0	d00uE	Position command deviation	d00uE	pulse	“xxxx”

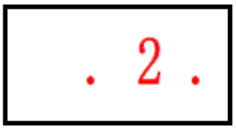
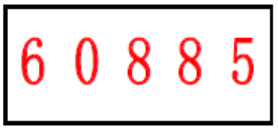
If EtherCAT is not connected, " " is displayed  after power on.

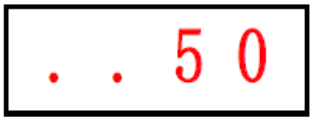
Description of data monitoring function

Data is differentiated as below.





High bit: 1st and 2nd values on the right has two decimal points Low bit: 1st and 2nd values on the right has no decimal point.



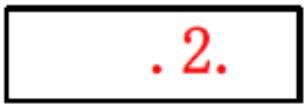
Mositive: 1st and 2nd values on the left has no decimal point. Kegative: 1st and 2nd values on the left has two decimal points

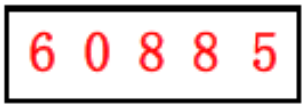
1. d00uE Position command deviation

Shows high bit and low bit of position deviation

Positive: 1st and 2nd values on the left has no decimal point.
Negative: 1st and 2nd values on the left has two decimal points

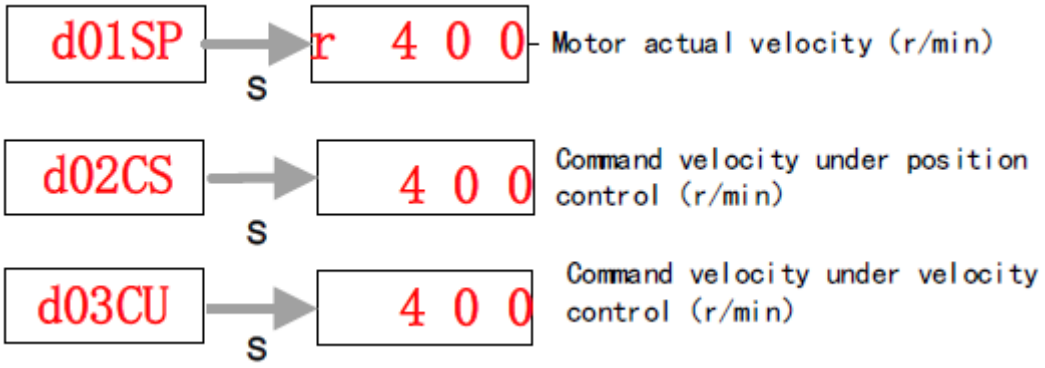
Press ◀ to switch between low and high bit
Example : Position command deviation=260885





High bit: 1st and 2nd values on the right has two decimal points
Low bit: 1st and 2nd values on the right has no decimal point.

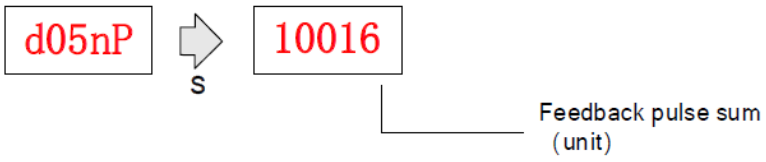
2. d01SP Motor velocity, d02CS Position control command velocity, d03CU Velocity control command velocity



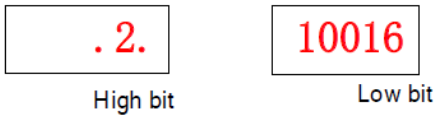
3. d04tr Actual torque feedback

4. d05nP Feedback pulse sum d06CP Command pulse sum

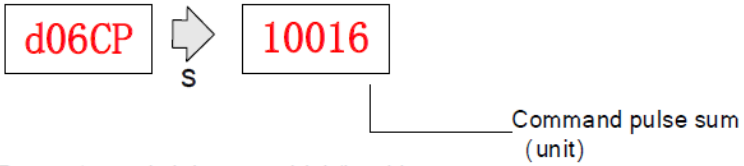
Feedback pulse sum(Encoder feedback pulse)



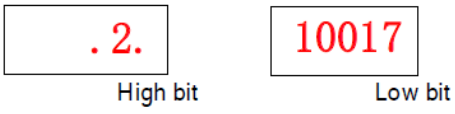
Press ◀ to switch between high/low bit
Example: Feedback pulse sum=210016



Command pulse sum (Command pulse)

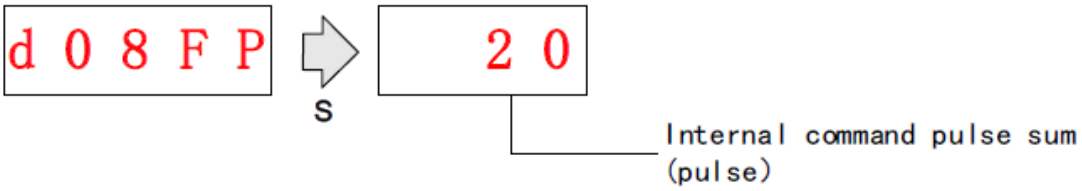


Press ◀ to switch between high/low bit
Example: Command pulse sum=210017

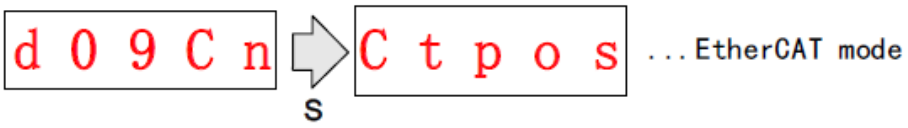


5. d07 Maximum torque during motion

6. d08FP Internal command pulse sum



7. d09Cn Control mode

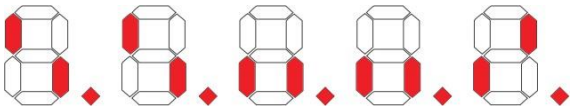


8. d10Io I/O signal status

When the top half of the digital tube is lighted, the signal is valid; when the bottom half of the digital tube is lighted, the signal is not valid. Decimal points represent I/O status, input when lighted, output when not lighted.

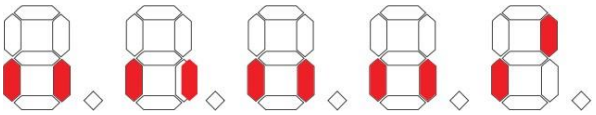
■ Input： From low to high bit (Right to left) DI1, DI2…. DI10. Decimal point is lighted to represent input signals.

In the example below, DI1, DI8 and DI10 input signal is valid; DI2-DI7, DI9 input signal is invalid.

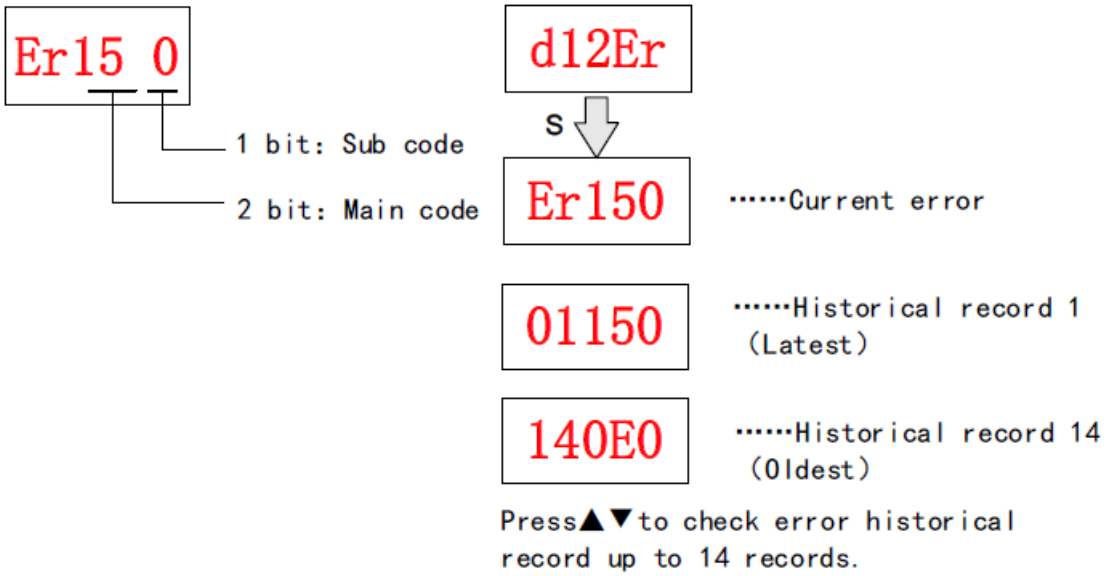


■ Output From low to high bit (Right to left) DO1, DO2….DO10. Decimal point is not lighted to represent output signals.

In the example below, DO1 output signal is valid; DO2-DO10 output signal is invalid.

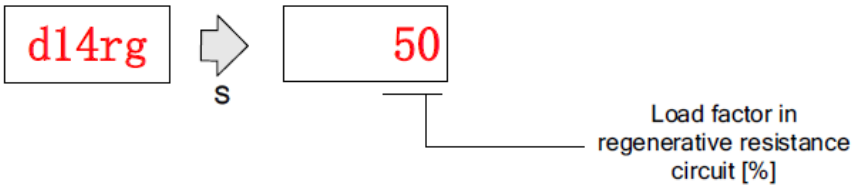


9. d12Er Alarm cause and historical record

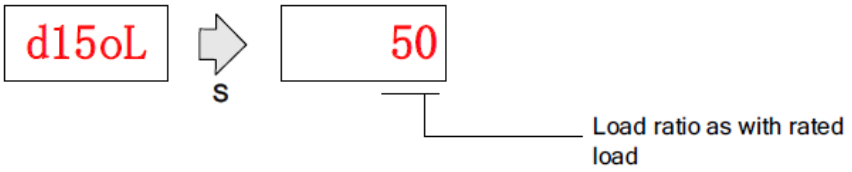


10. d14rg Regenerative load factor d15oL Overload factor

Regenerative load factor （Er120 might occur, if the value increases indefinitely）



Overload factor （Er100 might occur, if the value increases indefinitely）



11、d16Jr Inertia ratio

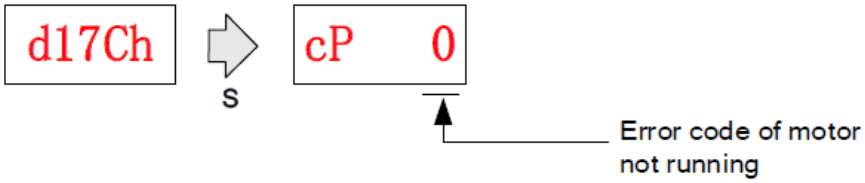
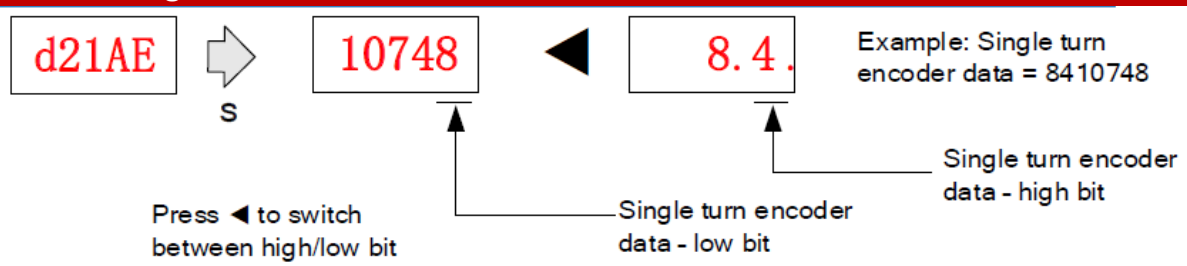
12、d17Ch Motor not running cause



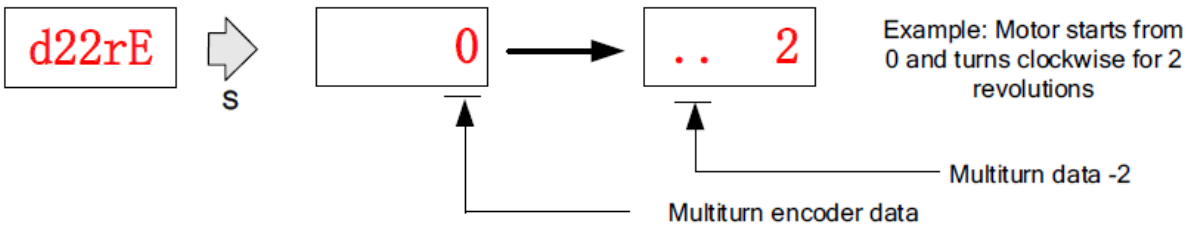
"d17Ch" Motor No Running Cause - Codes & Descriptions

Display Code	Description	Content
cP 1	DC bus undervoltage	/
cP 2	No SRV-ON signal	Servo-ON input (SRV-ON) is not connected to COM-
cP 3	POT/NOT input valid	Pr5.04 = 0, POT is in open circuit, velocity command is in positive direction NOT is in open circuit, velocity command is in negative direction
cP 4	Driver alarm	/
cP 5	Relay not clicked	/
cP 6	Emergency stop valid	/
cP 7	Position command too low	/
cP 8	Torque limitation	/
cP 9	Zero speed clamp valid	Pr3.15 = 1, Zero speed clamp input is open
cP 10	Velocity mode command velocity too low	In velocity mode, the command velocity is too low
cP 12	Torque mode command torque too low	In torque mode, the torque limit is too low.
cP 13	Velocity limit	Emergency stop command from main bus is valid

13、d21AE Single turn encoder data d22rE Multiturn encoder data



For 23-bit encoder, single turn encoder data = 0~8388607.Each value corresponds to certain position in a single revolution of the rotor, clockwise motion as negative, counter clockwise motion as positive. When counter clockwise single turn data > 8388607, multiturn data +1, clockwise single turn data < 0, multiturn data -1.



Multiturn encoder data range: -32768~+32767, As no. of revolution goes over range,32767 will jump to -32768、 -32767(counter clockwise) ； -32768 will jump to 32767、 32766 (clockwise)

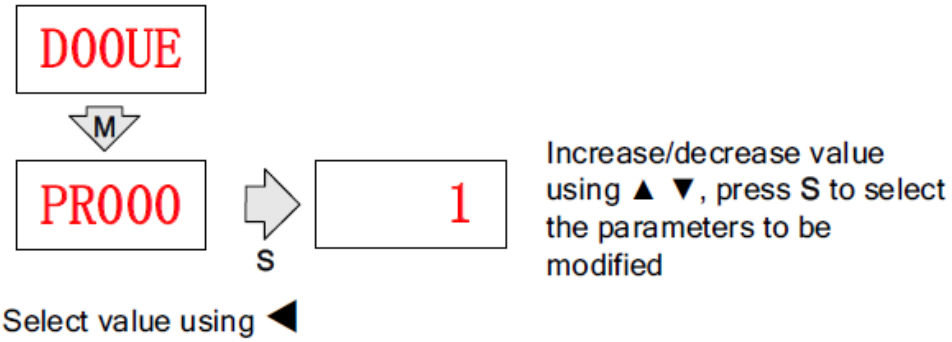
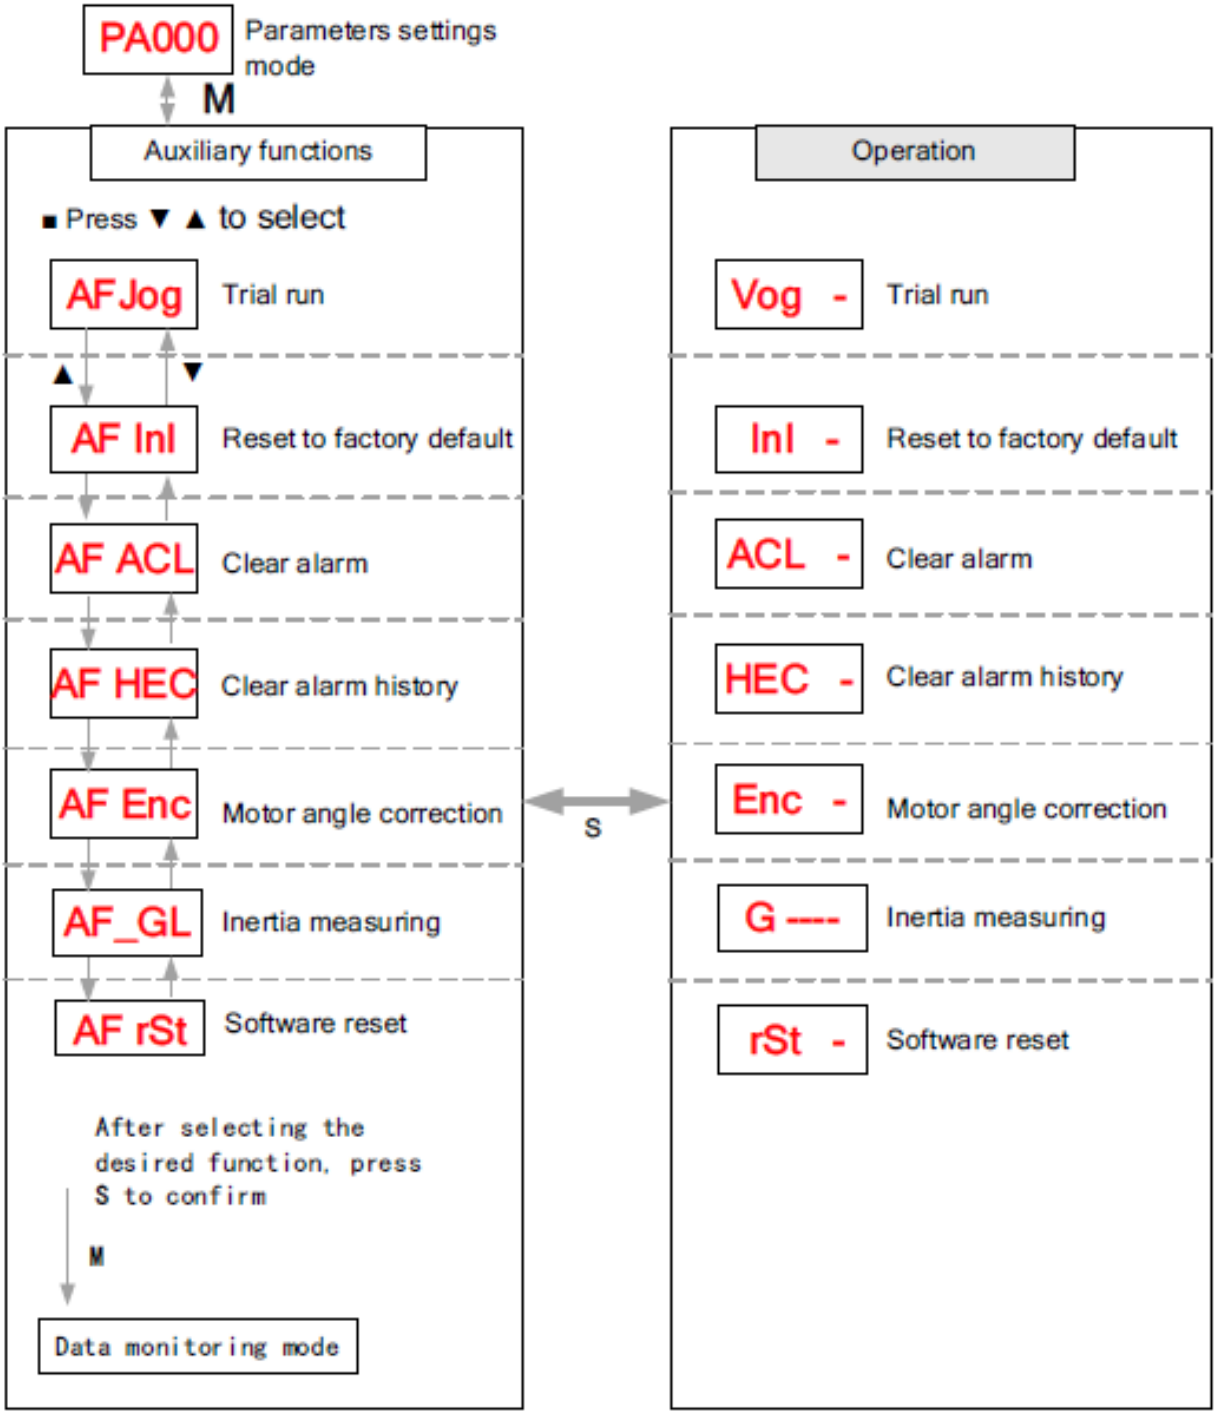
4.5 Parameter saving using front Panel



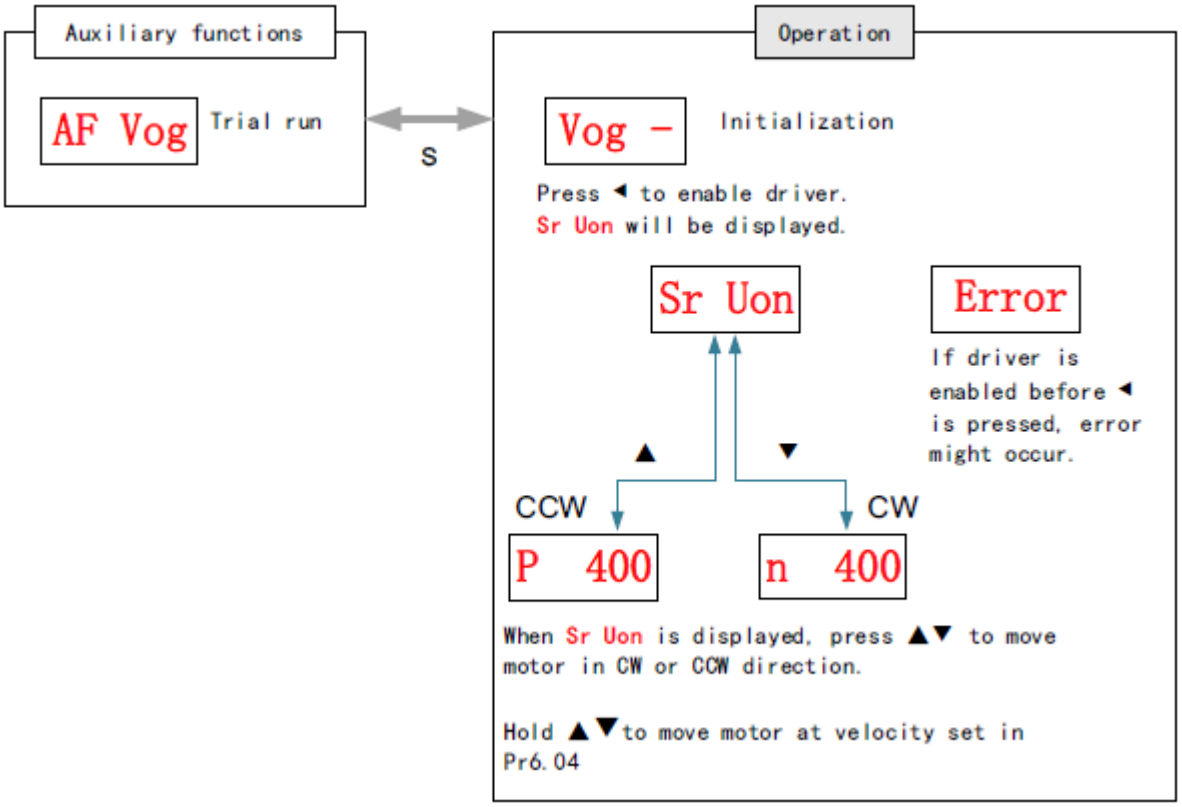
After modifying the selected Parameter to desired values, press S to confirm and save the changes.

4.6 Auxiliary functions



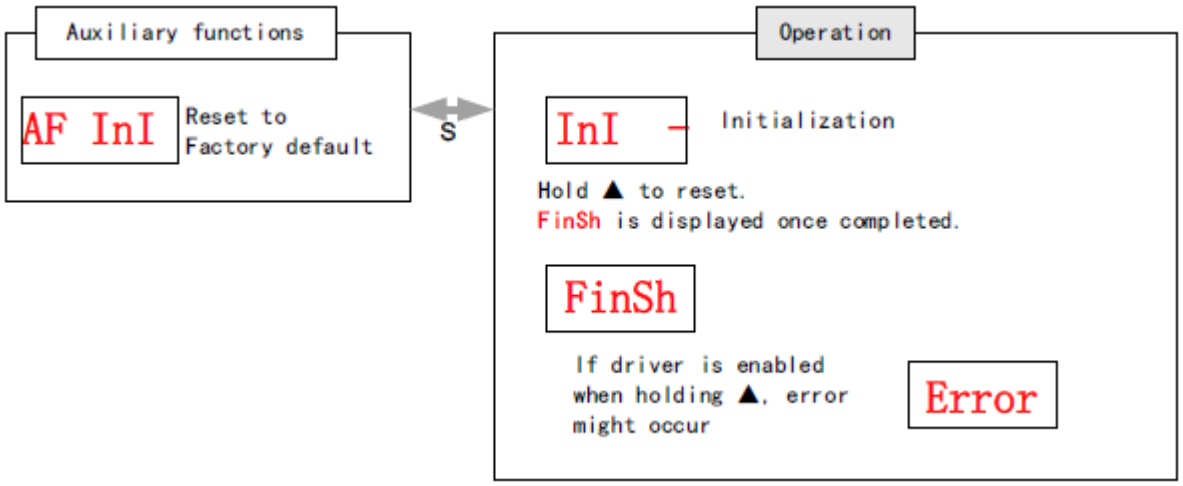
AF jog Trial run

Please disable servo driver before performing any trial run. Please don't modify gain related Parameter s during trial run to prevent any occurrence of mechanical vibrations. Press S to exit trial run.



AF InI Reset to factory default

To reset parameters settings to factory default. Can be used to reset parameters using auxiliary function on front panel or using object dictionary.

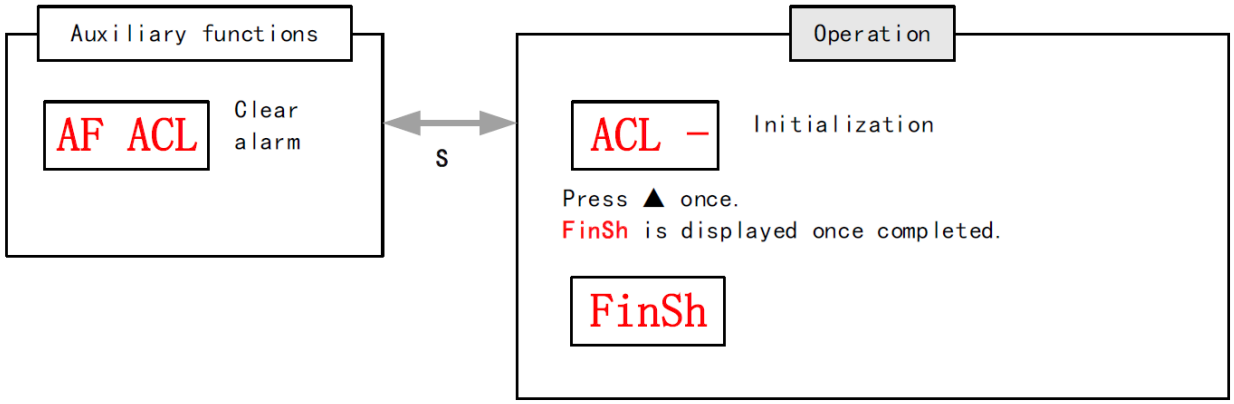


Reset to factory default using object dictionary

Object dictionary	Parameter s to reset	Method
0x1011-01	All Parameter s	Controller can reset all Parameter s using 0x1011-01. If driver receives the data of 0x1011-01 as 0x64616f6c, all Parameter s will be reset to factory default and 1011-01=1 after saving.
0x1011-02	Communication Parameter s	Controller can reset communication Parameter s using 0x1011-02. If driver receives the data of 0x1011-02 as 0x64616f6c, communication Parameter s will be reset to factory default and 1011-02=1 after saving.
0x1011-03	402 Parameter s	Controller can reset 402 Parameter s using 0x1011-03. If driver receives the data of 0x1011-03 as 0x64616f6c, 402 Parameter s will be reset to factory default and 1011-03=1 after saving.
0x1011-04	Drivers' supplier Parameter s	Controller can reset drivers' supplier Parameter s using 0x1011-04. If driver receives the data of 0x1011-04 as 0x64616f6c, drivers' supplier Parameter s will be reset to factory default and 1011-04=1 after saving.

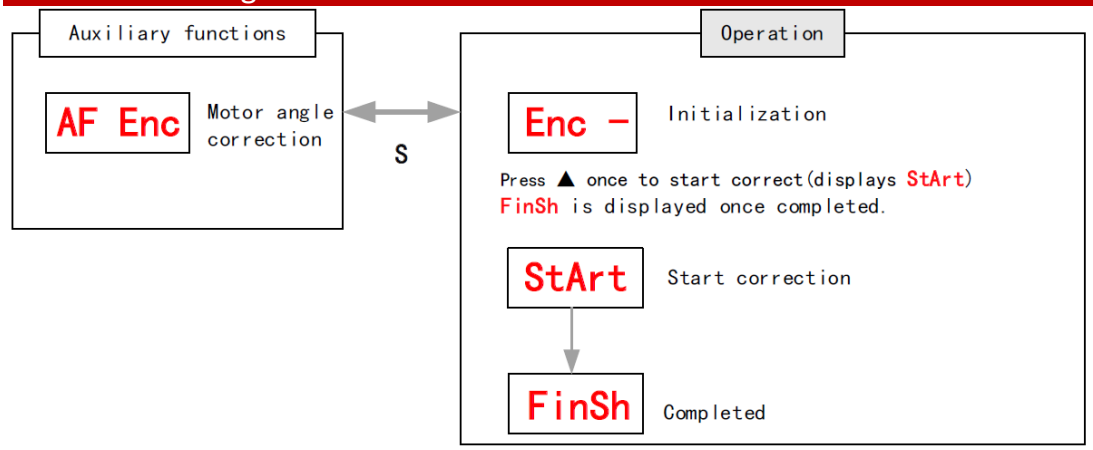
AF ACL Clear alarm

Alarm can be cleared using this auxiliary function but before that, the error needs to be solved and driver needs to be restarted.



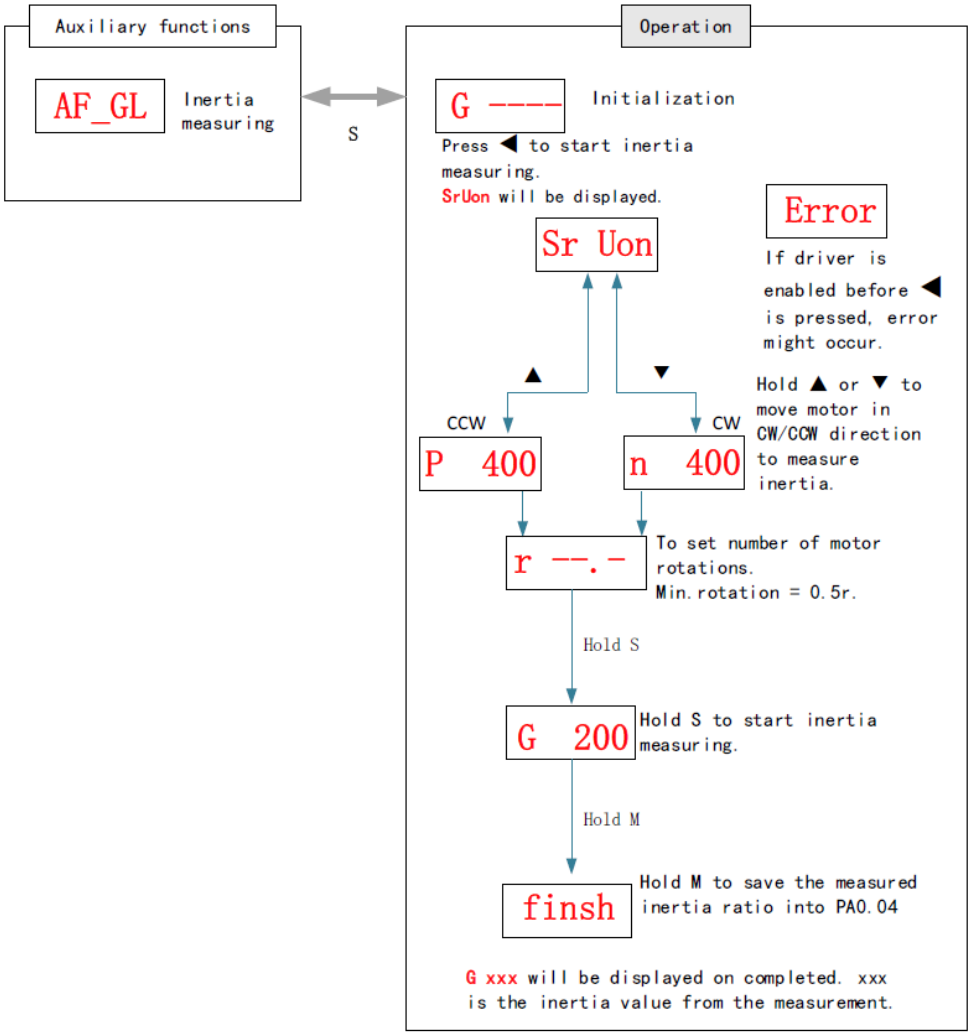
For alarms that can be cleared using this function, please refer to table in Chapter 9.

AF Enc Motor angle correction



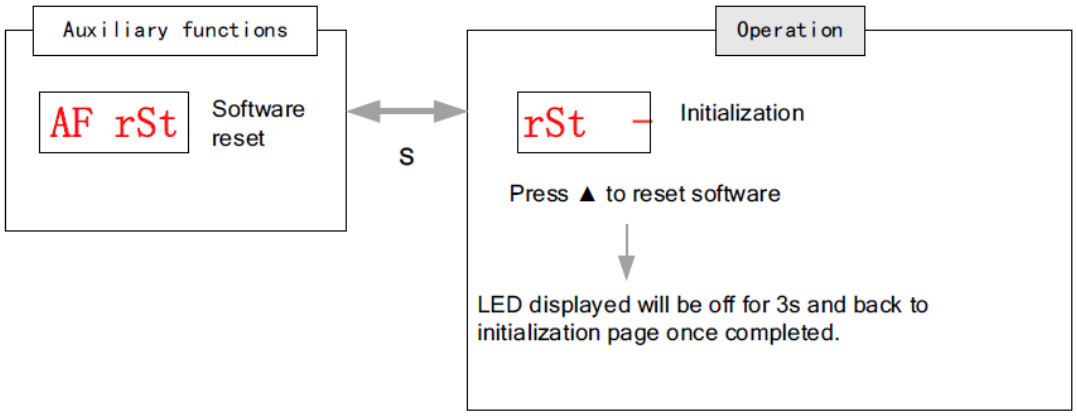
AF_GL Inertia measuring

Please make sure to use suitable velocity and acceleration for the measuring process. Press S to exit and disable the driver once completed.



AF Enc Motor angle correction

Software reset is used mainly on parameters modification that takes effect only after driver restart.



Chapter 5 Control Mode

5.1 OSD-H-*-E motion control step-by-step

A. EtherCAT master device sends "control word (6040h)" to initialize the drive.
B. Driver sends feedback "status word (6041h)" to the master device to indicate ready status (status word indication).
C. Master device sends enable command (control word switch).
D. The driver enables and sends feedback status to the master device.
E. The master station sends homing command to home the axis. (Homing Parameter and control word switch)
F. Driver returns to home and sends feedback homed status to master device (status word indication)
G. The master station sends the position mode command for position movement (position motion Parameter s and control word switch) or sends the velocity command for velocity movement (velocity motion Parameter s and control word switch).
H. When the drive is finished executing the command (position command), OSD-H-*-E feedbacks the position/velocity to the master device for monitoring during the motion.
I. The master device sends commands for the next motion.

5.2 CiA 402 State Machine

State machine switchover diagram

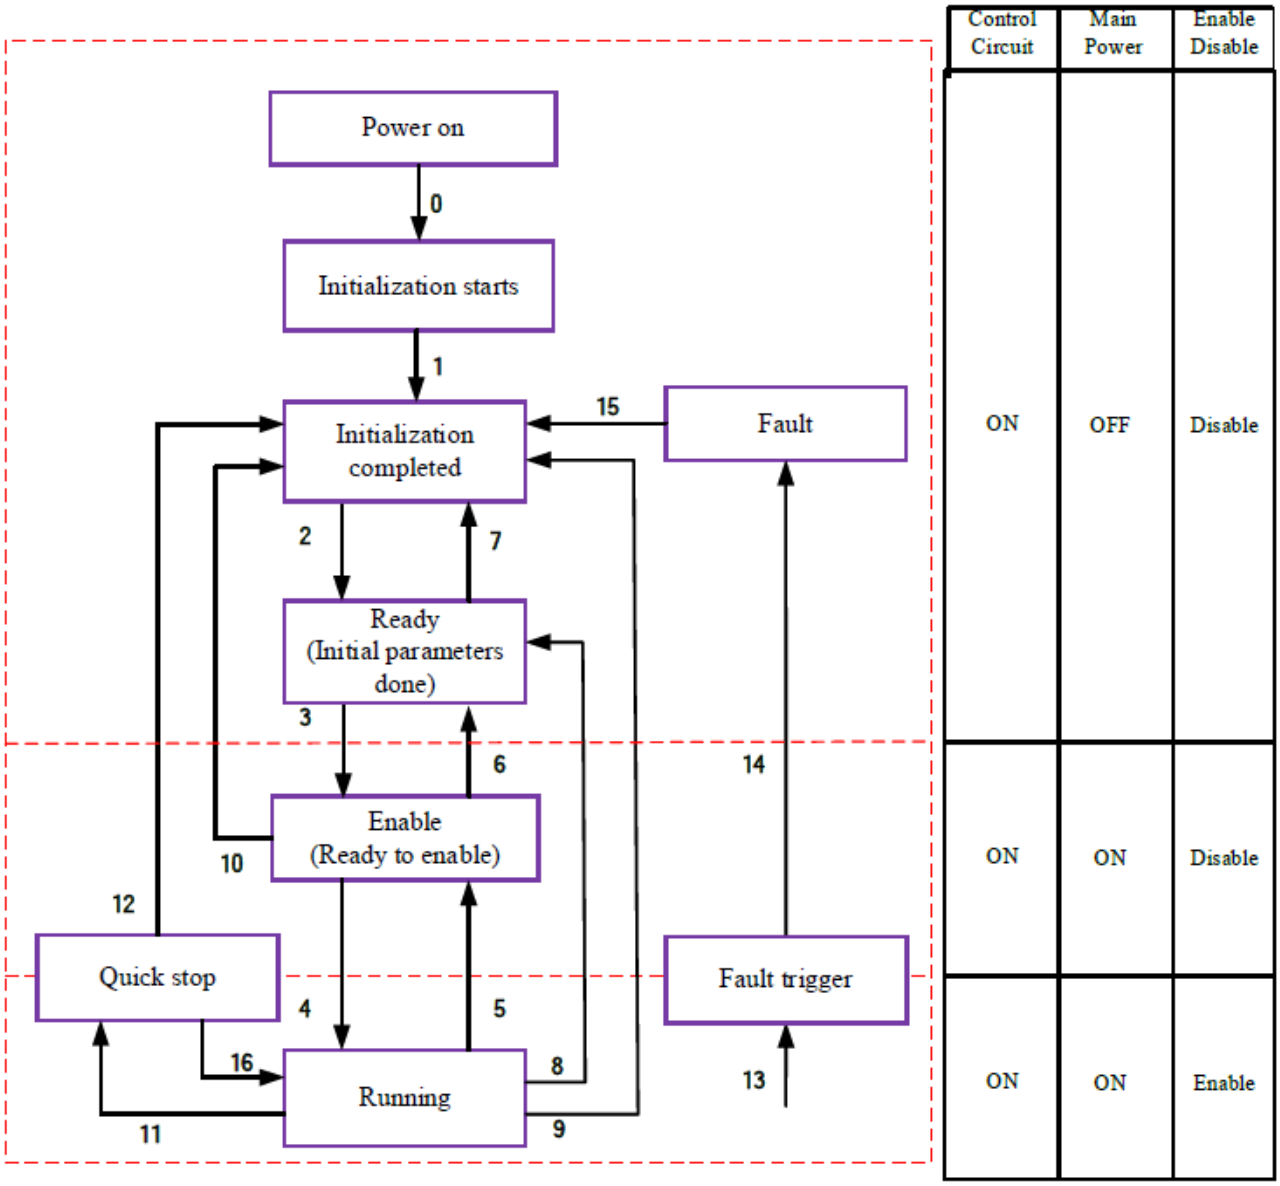


Figure 5.1 OSD-H-*-E 402 State Machine switchover diagram

Table 5.1 Status description

Status	Description
Initialization starts	Driver powered on, initialization starts; Holding brake activated; Axis disabled
Initialization done	Initialization done; Parameter s initializes, faultless; Axis disabled.
Ready	Parameter initialization done; Axis disabled.
Enable	Servo driver is ready to be enabled.
Running	Driver enabled, faultless
Quick stop	Quick stop activated
Fault triggered	Alarm not solved yet; Axis disabled.
Fault	Alarm solved. Waiting to switch from 402 state machine to Initialization starts; Axis disabled.

402 state machine switching is dependent on master device-controlled servo driver control word (6040h)

CiA402 status switching		Control word 6040h	Status word 6041h Bit1-Bit9
0	Power on Initialization	Transit automatically	0x0000
1	Initialization Faultless	Transit automatically, Enter 13 if fault occurs	0x0250
2	Faultless-- Ready	0x0006	0x0231
3	Servo ready-- Waiting to enable	0x0007	0x0233
4	Waiting to enable-- Running	0x000F	0x0237
5	Running Waiting to enable	0x0007	0x0233
6	Waiting to enable Ready	0x0006	0x0231
7	Ready Faultless	0x0000	0x0250
8	Running Ready	0x0006	0x0231
9	Running-- Faultless	0x0000	0x0250
10	Waiting to enable Faultless	0x0000	0x0250
11	Running-- Quick stop	0x0002	0x0217
12	Quick stop Faultless	Transit automatically	0x0250
13	Fault stop	Transit automatically	0x021F
14	Fault stop-- Fault	Transit automatically	0x0218
15	Fault Faultless	0x80	0x0250
16	Quick stop-- Running	0x0F	0x0237

5.3 Driver Control Mode Setting

5.3.1 Supported control mode (6502h)

OSD-H-*-E supports seven modes, as defined in 6502h.

Bit	31~10	9	8	7	6	5	4	3	2	1	0
Mode	Reserved	CST	CSV	CSP	Reserved	HM	Reserved	PT	PV	Reserved	PP
1: Supported	0	1	1	1	0	1	0	1	1	0	1

Description	Abbr.
Profile position mode	PP
Profile velocity mode	PV
Profile Torque mode	PT
Homing mode	HM
Cyclic synchronous position mode	CSP
Cyclic synchronous velocity mode	CSV
Cyclic synchronous torque mode	CST

5.3.2 Operational mode setting (6060h) and Operational mode display (6061h)

The operation mode of the servo drive is set in 6060h. The operation mode of the servo drive is viewed in 6061h.

Bit	Description	Abbr.
1	Profile position mode	PP
3	Profile velocity mode	PV
4	Profile Torque mode	PT
6	Homing mode	HM
8	Cyclic synchronous position mode	CSP
9	Cyclic synchronous velocity mode	CSV
10	Cyclic synchronous torque mode	CST

5.4 Common Functions for All Modes

5.4.1 Digital input setting and status display

Please refer to chapter 5 for more details on digital I/O input and polarity settings.60FDh object complies with IEC61800-200 standard input I/O status mapping object. 60FDh is set according to function as the table below shows.

Bit31	Bit30	Bit29	Bit28	Bit27	Bit26	Bit25	Bit24
Z signal	Reserved	Reserved	Reserved	Touch Probe 2	Touch Probe 1	BRAKE	INP/V-COIN /TLC
Bit23	Bit22	Bit21	Bit20	Bit19	Bit18	Bit17	Bit16
E-STOP	Reserved	Reserved	Reserved	Reserved	Reserved	DI14	DI13
Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8
DI12	DI11	DI10	DI9	DI8	DI7	DI6	DI5
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
DI4	DI3	DI2	DI1	Reserved	HOME	POT	NOT

5.4.2 Digital output setting and control operation method

In addition to the internal operation of the servo system, OSD-H-*-E also provides a function for the master device to operate digital I/O output of the servo driver.

If I/O output function is set up as master device control, master device can control servo driver digital I/O output through 60FEh object

Bit Sub-index	31~21	21	20	19	18	17	16	15~0
01h	Reserved	DO6 valid	DO5 valid	DO4 valid	DO3 valid	DO2 valid	DO1 valid	Reserved
02h		DO6 enabled	DO5 enabled	DO4 enabled	DO3 enabled	DO2 enabled	DO1 enabled	

5.4.3 Motor Rotational Direction

Rotational direction is defined in 607Eh.

Mode		Set value
Position Mode	PP HM CSP	0：Rotate in the same direction as the position command 128：Rotate in the opposite direction to the position command
Velocity Mode	PV CSV	0：Rotate in the same direction as the position command 64：Rotate in the opposite direction to the position command
Torque Mode	PT CST	0：Rotate in the same direction as the position command 32：Rotate in the opposite direction to the position command
ALL Modes		0：Rotate in the same direction as the position command 224：Rotate in the opposite direction to the position command

5.4.4 Stop Settings

OSD-H-*-E provides quick stop function. Stopping is different under different modes. Controlled by using object dictionary 605A.

Index 605Ah	Label	Quick stop option code			Mode	F		
	Range	0~7			Default	2	Unit	-
	Structure	VAR	Type	INT16	Mapping	-	Access	RW

Motor stops when quick stop option code is given.

PP, CSP, CSV, PV

0 : To stop motor through PR5.06. Status: Switch on disable, axis disabled.

1 : Motor decelerates and stops through 6084. Status: Switch on disable, axis disabled.

2 : Motor decelerates and stops through 6085. Status: Switch on disable, axis disabled.

3 : Motor decelerates and stops through 60C6. Status: Switch on disable, axis disabled.

5 : Motor decelerates and stops through 6084. Status: Quick stop

6 : Motor decelerates and stops through 6085. Status: Quick stop

7 : Motor decelerates and stops through 60C6. Status: Quick stop

HM

0 : To stop motor through PR5.06. Status: Switch on disable, axis disabled.

1 : Motor decelerates and stops through 609A. Status: Switch on disable, axis disabled.

2 : Motor decelerates and stops through 6085. Status: Switch on disable, axis disabled.

3 : Motor decelerates and stops through 60C6. Status: Switch on disable, axis disabled.

5 : Motor decelerates and stops through 609A. Status: Quick stop

6 : Motor decelerates and stops through 6085. Status: Quick stop

7 : Motor decelerates and stops through 60C6. Status: Quick stop

When 402 state machine is disabled, the motor will stop freely.
When bit8(Halt) of 6040h is 1, the motor will stop with deceleration set in 6083h/6084h.

5.4.5 Position mode – Electronic Gear

OSD-H-*-E position mode consists of cyclic synchronous position mode (CSP), protocol position mode (PP) and homing mode (HM), only in these three modes is the electronic gear valid.
Electronic gear ratio range is 0.001~8000(23-bit encoder), otherwise ErA00 might occur if over range (the warning is not saved, after modification to a reasonable range, alarm on operational Panel will automatically disappear, but the 402 state will still be in the "error" state, write 0x80 into 6040h).
Method 1:
Electronic gear ratio setting is defined by 608Fh (Position encoder resolution). 6091h (Gear ratio), 6092h (Feed constant) to change the motor position. Only valid under pre-operational mode.
608Fh (Position encoder resolution) is the resolution of the encoder, which is read internally without additional setting. 6092h_01 represents the number of pulses that can be set for each revolution of the motor.
6091h_01/6091h_02 is real-time update effective.
Electronic gear subdivision method can be determined by modifying 6092h_01 (Feed constant)

1. If 6092h_01 (Feed constant) is not equal to 608Fh (Position Encoder resolution), then: Electronic gear ratio = encoder resolution / 6092h_01

2. If 6092h_01(Feed constant) is equal to 608Fh (Position encoder resolution), then: Electronic gear ratio = 6091_01/6092h_01

Electronic gear ratio range is 0.001~8000(23-bit encoder), 0.001~2000(21-bit encoder)

Command pulse count per motor revolution needs to be □ Encoder Pulse Count per Revolution / 8000.

OSD-H series comes with motors with 21-bit and 23-bit encoder. Pulse count per revolution for 21-bit encoder = 209752; for 23-bit encoder = 8388608. From the condition above, the command pulse count per motor revolution for 21-bit encoder should be ≥ 263; for 23-bit encoder ≥ 1049.

Method 2:
Electronic gear can be set through Pr0.08. If Pr0.08 ≠ 0, Pr0.08 is valid. If Pr0.08 = 0, object dictionary 6092-01 is valid.

Note: when the setting value exceeds this range, the error will be reported and automatically reset to the default value. The default values of 6091_01, 6091_02 and 6092_01 are 1, 1 and 10000.

Position Limits
The hardware limit is valid in all operational modes, and the software limit is valid only in the absolute operational mode of cyclic synchronous position mode (CSP) and profile position mode (PP)
The limit of the software is defined by 607Dh. The maximum position in the negative direction is defined in 607d-01h and the maximum position in the positive direction is defined in 607d-02h, the unit is consistent with the command unit.
The setting of object dictionary 0x5012-04 not only affects the homing offset of 607C, but also affects the software limit, 607D needs to be modified before the operational state

5012-04		Actual Positive Position Limit		Actual Negative Position Limit	
Bit2	Bit3				
0	0	607D-02 + 607C	607D-02	607D-01 + 607C	607D-01

OSD-H-*-E Software position limits valid conditions:

1. It can only be set in the pre-operational state of ESM. It is recommended to configure it by SDO when the system starts.
2. Only in the absolute mode of CSP and PP, in CSP mode, it is recommended to use the software limit function of the master station to achieve the fastest limit performance.
3. The incremental encoder motor is not effective until the homing process completed.
4. The setting rule is 607d-01h < 607d-02h, that is, the negative position limit value is less than the positive position limit value.

5.4.6 Control Word

Bit definition of Control Word 6040h.

Bit	15~11	10~9	8	7	6~4	3	2	1	0
Definition	-	-	Halt	Fault reset	Related to modes	Operation enable	Quick stop	Voltage output	Switch on

Command	Bit7 and Bit0 to Bit3					6040 Value	402 State machine *1)
	7：Fault reset	3：Operation enable	2：Quick stop	1：Voltage output	0：Start		
Power off	0	×	1	1	0	0006h	2;6;8

Fault reset	Rising edge	×	×	×	×	0080h	15

× is not affected by this bit state

* Indicates that this transition is performed in the device start state

** indicates that it has no effect on the start state and remains in the start state

*1) The state machine switch corresponds to figure 7.1

The definition of bit 8 and bit 6~4 in different operation modes is shown in the following table

Bit	Operation Mode						
	Profile Position (PP)	Profile Velocity (PV)	Profile Torque (PT)	Homing (HM)	Cyclic Sync Position (CSP)	Cyclic Sync Velocity (CSV)	Cyclic Sync Torque (CST)
8	Stop with deceleration	Stop with deceleration	Stop with deceleration	Stop with deceleration	-	-	-
6	Absolute/ Increment	-	-	-	-	-	-
5	Immediately trigger	-	-	-	-	-	-
4	New Position	-	-	Start	-	-	-

5.4.7 Status Word

Bit definition of Status Word 6041h.

Bit	Definition
15~14	Reserved
13~12	Related to modes
11	Position limit valid
10	Position arrival
9	Distance
8	Related to modes
7	Reserved
6	Not switch on
5	Quick stop
4	Voltage output
3	Fault
2	Operation enable
1	Switch on
0	Ready to switch on

Bit 11 is valid when the software or hardware limit is in effect.

The combination of bit 6 and bit 3~0 represents the device state shown in following table

Combination of bit 6 and bit 3~0	Description
××××, ××××, ×0××,0000	Not ready to switch on
××××, ××××, ×1××,0000	Switch on disabled
××××, ××××, ×01×,0001	Ready to switch on
××××, ××××, ×01×,0011	Switch on
××××, ××××, ×01×,0111	Operation enabled
××××, ××××, ×00×,0111	Quick stop active
××××, ××××, ×0××,1111	Fault reaction active
××××, ××××, ×0××,1000	Fault

× is not affected by this bit state

The definition of bit 8 and bit 13~12 in different operation modes are shown in the following table

Bit	Operation Mode						
	Profile Position (PP)	Profile Velocity (PV)	Profile Torque (PT)	Homing (HM)	Cyclic Sync Position (CSP)	Cyclic Sync Velocity (CSV)	Cyclic Sync Torque (CST)
13	Position error is too large	-	-	Homing Process error	-	-	-
12	-	Velocity is 0	-	Homing Process completed	Following valid	Following valid	Following valid

8	Abnormal stop	-	-	Abnormal stop	Abnormal stop	-	-

5.4.8 Synchronous cycle time setting

The default synchronous cycle time range of OSD-H-*-E series is 250us – 10ms. Min value: 125us; Max value: 20ms. Please make sure the values set is the multiplier of 250us.

5.4.9 Driver Enabling

This section describes how to use control words 6040h/ status word 6041h command switching/status determination for OSD-H-*-E controlled motor.

Steps：

1：Write 0 to the control word 6040h, and then AND 0x250 by bit, whether it is equal to 0x250 2：Write 6 to the control word 6040h, and then AND 0x231 by bit, whether it is equal to 0x231 3：Write 7 to the control word 6040h, and then AND 0x233 by bit, whether it is equal to 0x233 4：Write 15 to the control word 6040h, and then AND 0x237 by bit, whether it is equal to 0x237

5.5 Position Mode (CSP, PP, HM)

5.5.3 Protocol Position Mode (PP)

Under non-synchronous mode, master device is responsible for only sending Parameter s and control command; After receiving enable command from master device, servo driver will plan motion route according to Parameter s. Under non-synchronous mode, motor motion between each axes are asynchronous.

From the perspective of servo driver functions, the difference between PP and CSP mode is that PP mode requires track generator function from OSD-H

Control and status words under PP mode

Control word bits 4~6 definition under PP mode

Bit	Value	Definition
4 (New position)	0—>1	Latest target position(607Ah) 、Profile velocity (6081h), Acc-/deceleration(6083h/6084h) Starts
5 (Instant trigger)	0	Trigger new position command once current one is completed.
	1	Interrupted current position command and trigger new position command
6(Absolute/relative)	0	Set target position(607Ah) as absolute position
	1	Set target position(607Ah) as relative position

5 motion structures under PP mode

Control words bit 5	0	1
Accelerates/ constant velocity toward target position		Decelerates towards target position		Target position in inversed direction		
A: Command switching time from master device

B: Arrival time before target position renewal

C: Arrival time after target position renewal

Thick line: Motion before command changed

Thin line： Motion after command changed

Status word bits 12-15, 10, 8 definitions under PP mode

Bit	Value	Definition
8(Abnormal Stop)	0	Normal motion
	1	Abnormal stop triggered, motor stopped *1)
10(Arrived at position)	0	Motion not completed
	1	Target position reached
12(New position)	0	Current motion completed/interruptible, able to execute new position command *2)
	1	Current motion not completed/interruptible, unable to execute new position command
14(Motion Parameter = 0)	0	Motion Parameter s valid, necessary Parameter s all not set to 0.
	1	Parameter = 0 under current motion. One of 3 Parameter s, Profile velocity (6081h), acceleration (6083h) and deceleration (6084h) = 0.
15(Trigger)	0	Current motion incomplete/uninterruptable, new target position cannot be renewed. *3)
	1	Current motion completed/interruptible, new target position can be renewed.

*1) Bit 8 abnormal stoppage usually valid when hardware limit, deceleration stoppage and quick stop are triggered.

*2) Bit 12 under control word(6040h) bit 5 valid and bit 4 invalid, motion interruptible.

*3) Bit 15 and bit 12 have inversed logic under PP mode.

Application: Realization of relative position motion

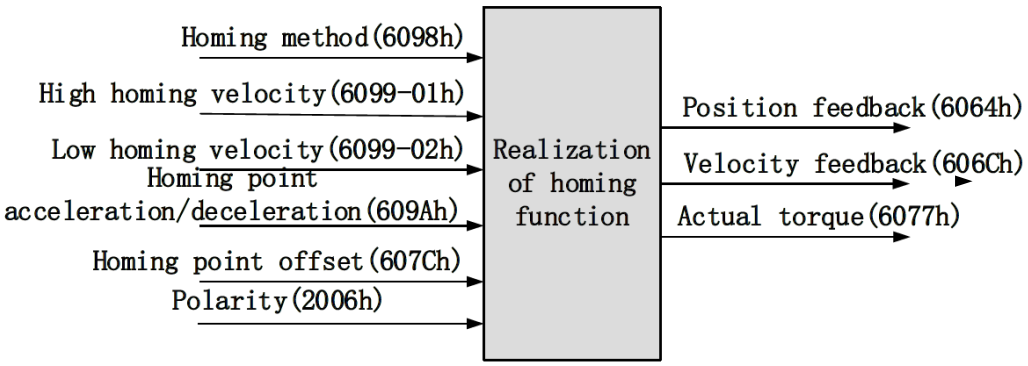
Step 1: 6060h = 1, determine if 6061h =1. Servo driver is now under PP mode.

Step 2: Write motion Parameter s: Target position 607Ah, Profile velocity 6081h, acceleration 6083h, deceleration 6084h

Step 3: Enable servo driver and switch bit 6 and 4 to realize relative position motion.

5.5.4 Homing mode (HM)

OSD-H-*-E servo system supports every other homing method except for method 36. Output/input Parameter s of OSD-H are as shown below.



Related Parameters

Control and status words under HM mode

Control word bit 4 definition under HM mode

Bit	Value	Definition
4(Homing motion starts/stops)	0—>1	Homing motion starts
	1 —>0	Homing motion stops, motor stops

Status word bits 12-15, 10, 8 definitions under PP mode

Bit	Value	Definition
8(Abnormal Stoppage)	0	Normal motion
	1	Abnormal stoppage triggered, motor stops *1)
10(Arrived at position)	0	Motion not completed
	1	Target position reached
12(Homing done)	0	Homing not done
	1	Homing done, valid after reaching position (bit 10) *2)
14(Motion Parameter = 0)	0	Motion Parameter s valid, necessary Parameter s all not set to 0.
	1	Parameter = 0 under current motion. One of 4 Parameter s, homing mode (6098h), high homing velocity(6099h-01), low homing velocity (6099h-02) and homing point acc-/deceleration (609Ah) = 0.
15(Trigger)	0	Homing triggered/completed *3)
	1	Homing triggers

*1) Bit 8 abnormal stoppage usually valid when hardware limit, deceleration stoppage and quick stop are triggered.

*2) Determine if homing is done, determine if bit 10/12 is occupied.

*3) Use to indicate if homing is able to trigger or already triggered.

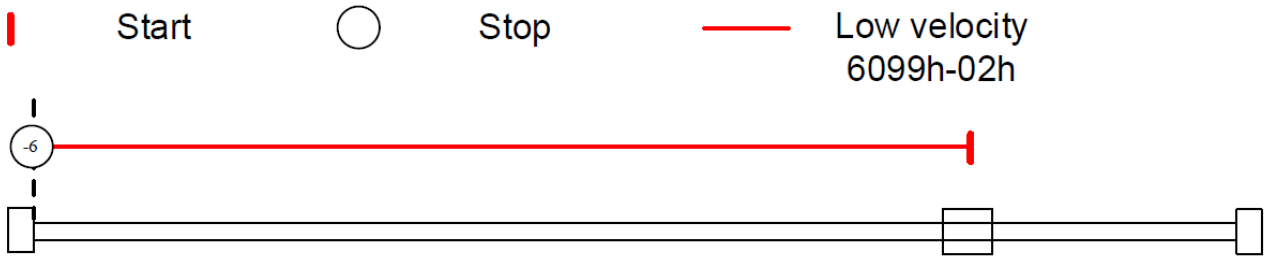
Incorrect position triggering conditions

Triggering condition	Remarks
Absolute encoder homing	Control words 6040h bit 4 from 0 to 1
2 limit switch signals detected	Positive and negative limit switches detected during homing
Negative limit valid when positive limit in used	Negative limit valid under 2,7-10,23-26 homing modes
Positive limit valid when negative limit in used	Positive limit valid under 1,11-14,27-30 homing modes
Limit switch valid when not in used	Limit switch valid under 3,4,19,20 homing modes
Limit switch/homing signal valid when only z-signal in used	Limit switch and homing sensor valid under 33,34 homing modes

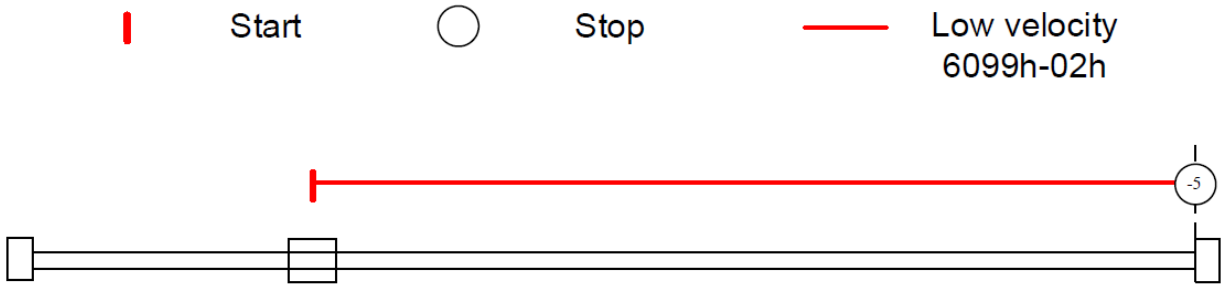
Homing mode

Torque limiting mode

Mode-6： Search for homing point in negative direction at low velocity. Stop after torque reaches the value set in PR5.39 and homing done signal is delivered.

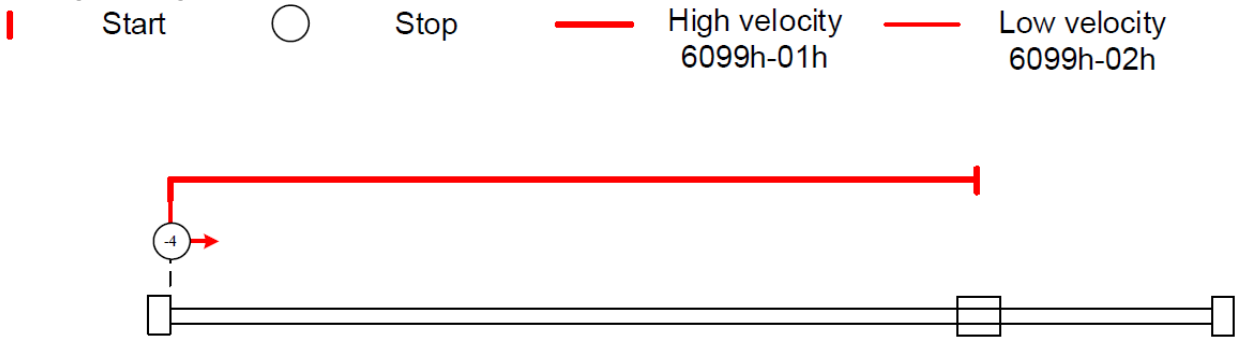


Mode -5： Search for homing point in positive direction at low velocity. Stop after torque reaches the value set in PR5.39 and homing done signal is delivered.

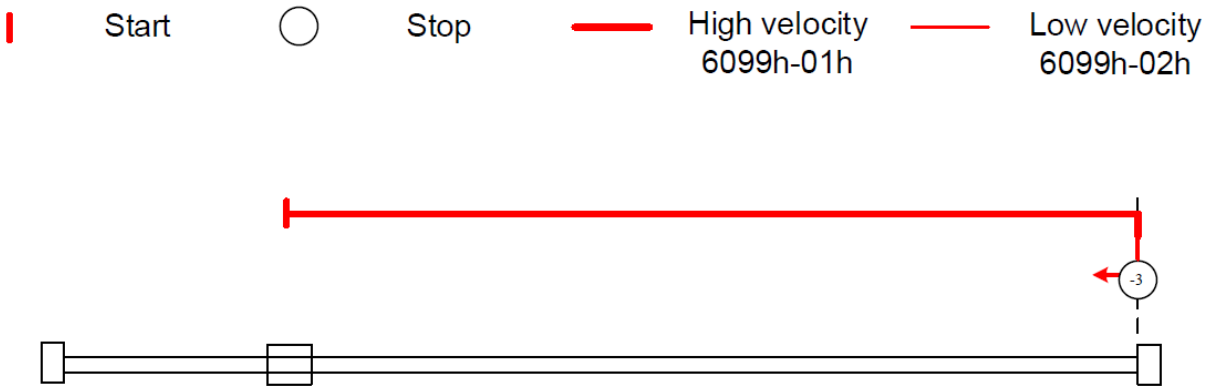


Mode -4： Search for homing point in negative direction at high velocity. Move in positive direction after torque reaches the value set in PR5.39, stops when torque is gone.

Homing done signal delivers after the time value set in PR5.37

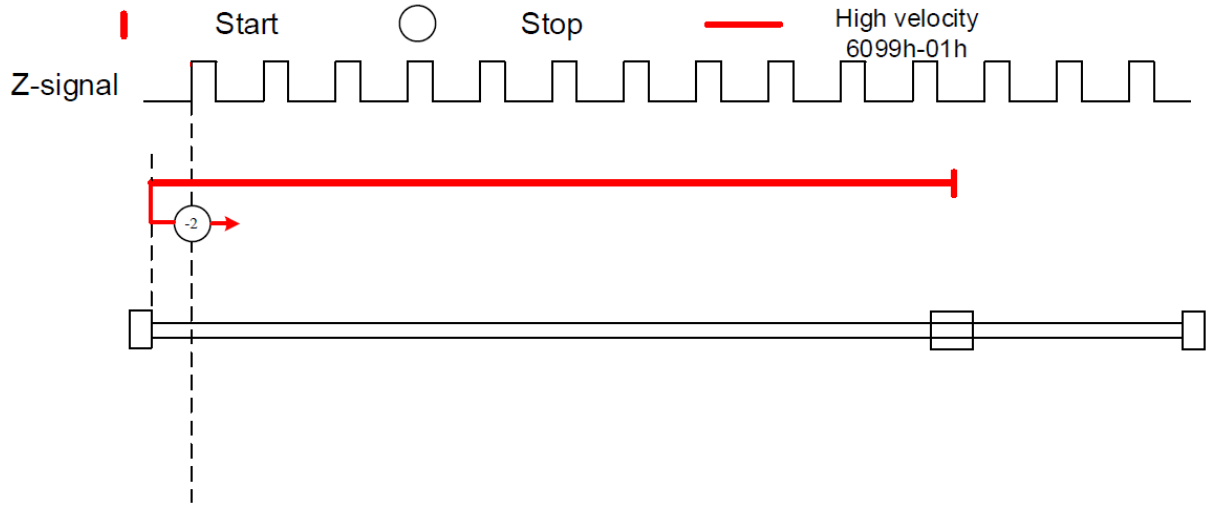


Mode -3： Search for homing point in positive direction at high velocity. Move in negative direction after torque reaches the value set in PR5.39, stops when torque is gone. Homing done signal delivers after the time value set in PR5.37

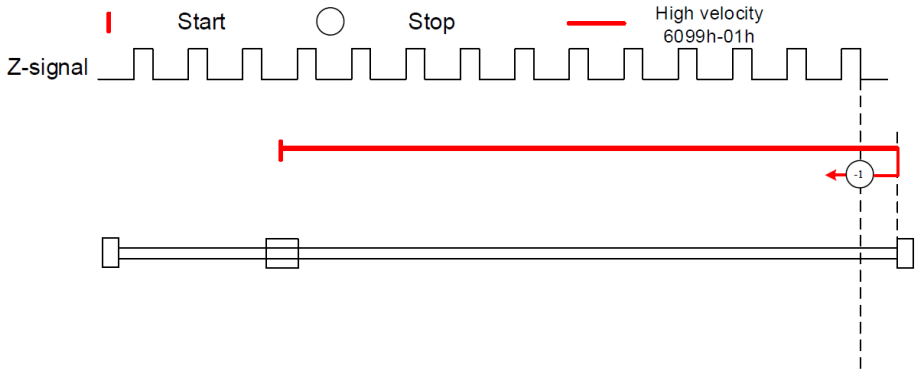


Torque limiting + Z-signal mode

Mode -2： Search for homing point in negative direction at high velocity. Move in positive direction after torque reaches the value set in Pr5.39, stops when torque is gone with the first Z-signal.



Mode -1： Search for homing point in positive direction at high velocity. Move in negative direction after torque reaches the value set in Pr5.39, stops when torque is gone with the first Z-signal.



Limit switch signal + Z-signal mode

Mode 1:

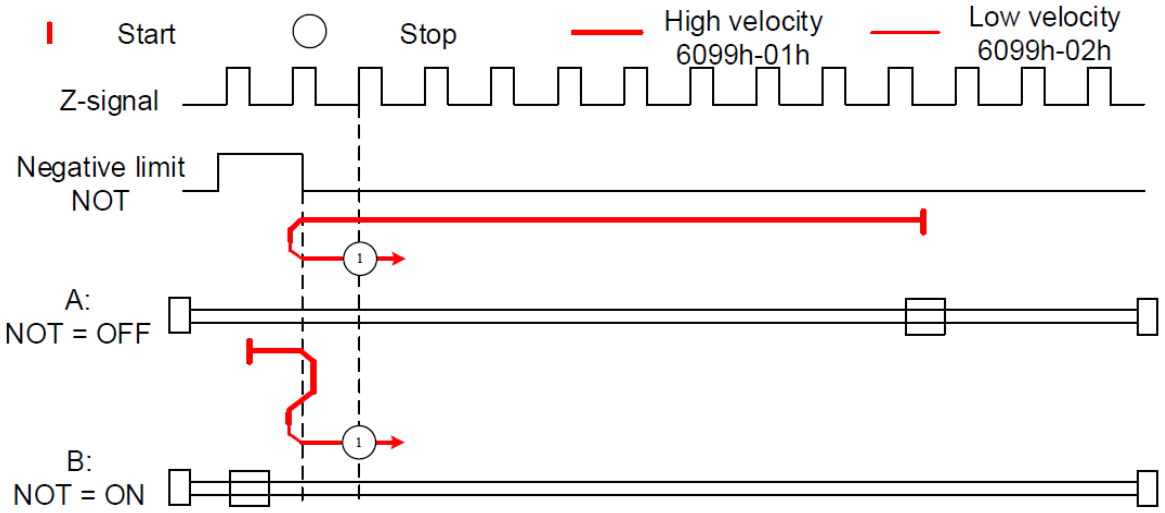
Diagram A: *Negative limit switch = OFF*

1. Move in negative direction at high velocity until negative limit switch valid.
2. Move in positive direction at low velocity and stops after negative limit switch and first encoder Z-signal valid

Diagram B: *Negative limit switch = ON*

1. Start to move at negative limit switch position in positive direction at high velocity until negative limit switch invalid.
2. Move in negative direction at high velocity until negative limit switch valid.
3. Move in positive direction at low velocity and stops after negative limit switch and first encoder Z-signal valid

If the positive limit signal is valid during the homing process, the status word (6041h) bit 13 will be valid, indicating homing error and the motor will stop immediately.



Mode 2:

Diagram A: *Positive limit switch = OFF*

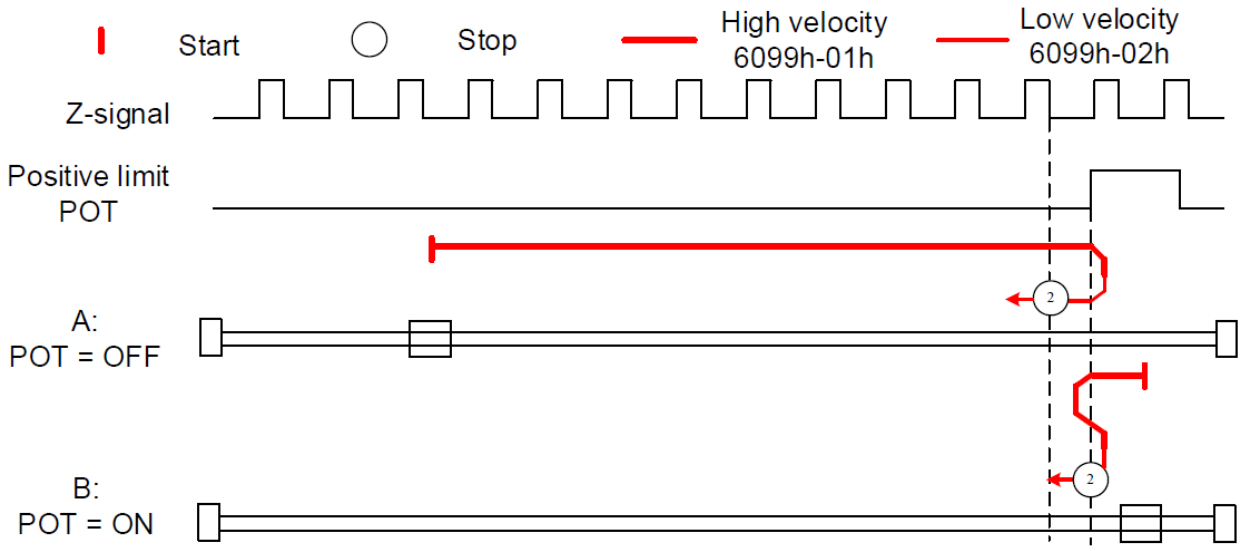
1. Move in positive direction at high velocity until positive limit switch valid.
2. Move in negative direction at low velocity and stops after positive limit switch and first encoder Z-signal valid

Diagram B: *Positive limit switch = ON*

1. Start to move at positive limit switch position in negative direction at high velocity until positive limit switch invalid.
2. Move in positive direction at high velocity until positive limit switch valid.
3. Move in negative direction at low velocity and stops after positive limit switch and first encoder Z-signal valid

If the negative limit signal is valid during the homing process, the status word (6041h) bit 13 will be valid,

indicating homing error and the motor will stop immediately.



Homing switch signal + Z-signal mode

Mode 3:

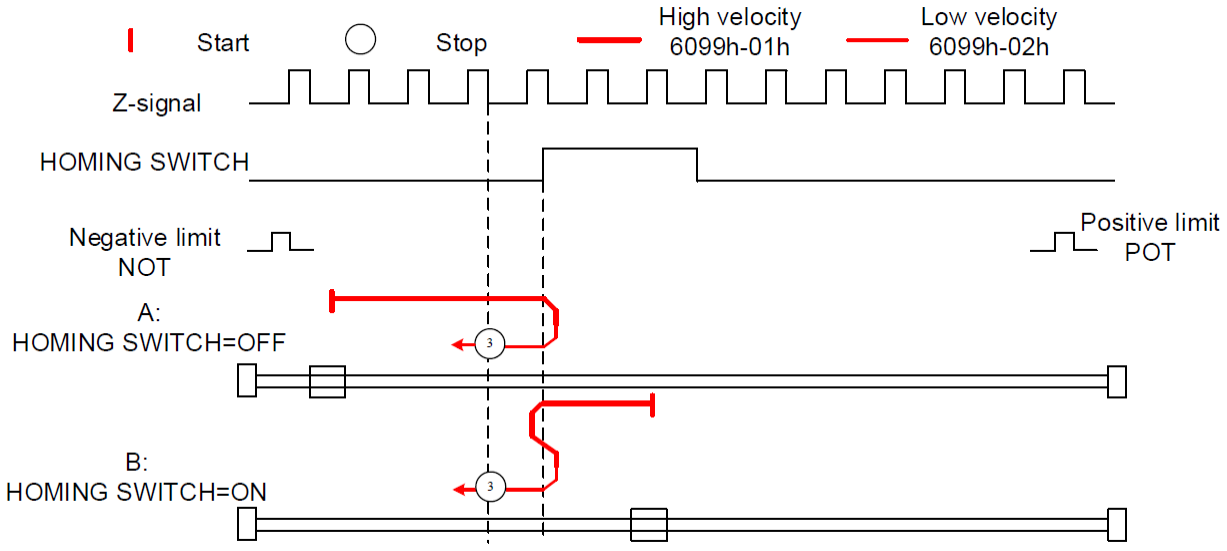
Diagram A: *Homing switch = OFF*

1. Move in positive direction at high velocity until homing switch valid.
2. Move in negative direction at low velocity and stops after homing switch and first encoder Z-signal valid

Diagram B: *Homing switch = ON*

1. Start to move at homing switch position in negative direction at high velocity until after homing switch.
2. Move in positive direction at high velocity until homing switch valid.
3. Move in negative direction at low velocity and stops after homing switch and first encoder Z-signal valid

If the positive/negative limit switch signal is valid during the homing process, the status word (6041h) bit 13 will be valid, indicating homing error and the motor will stop immediately.



Mode 4:

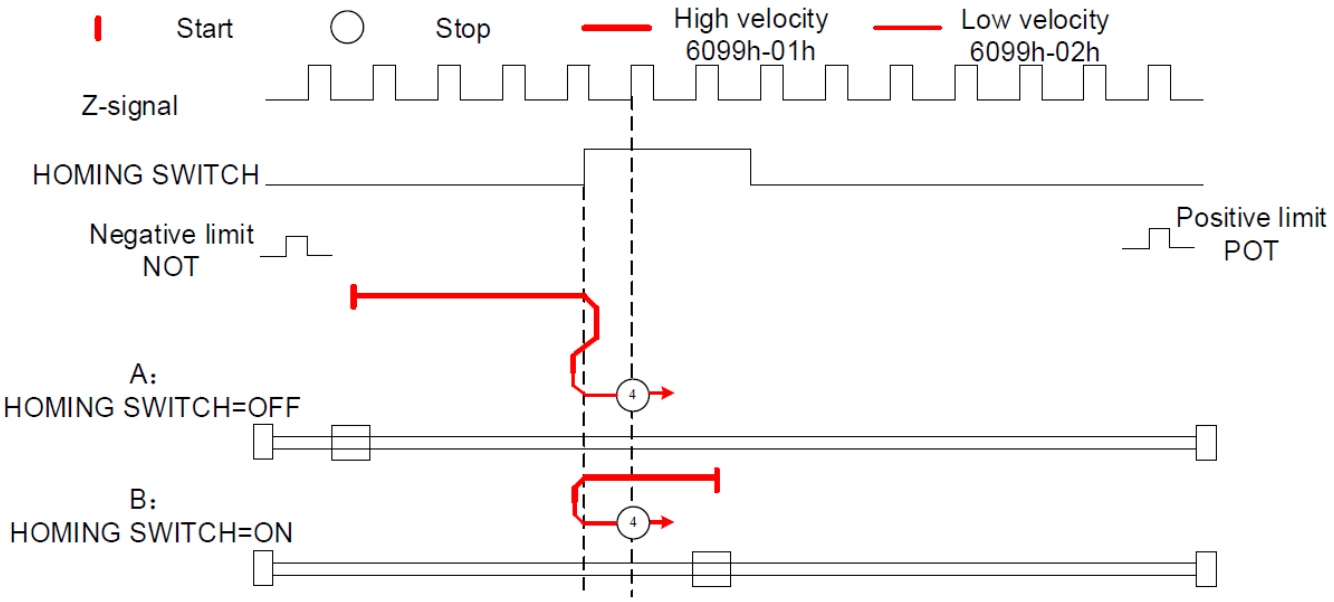
Diagram A: *Homing switch = OFF*

1. Move in positive direction at high velocity until homing switch valid.
2. Move in negative direction at high velocity until homing switch invalid.
3. Move in positive direction at low velocity and stops after homing switch valid and first encoder Z-signal valid

Diagram B: *Homing switch = ON*

1. Start to move at homing switch position in negative direction at high velocity until after homing switch.
2. Move in positive direction at low velocity and stops after homing switch valid and first encoder Z-signal valid

If the positive/negative limit switch signal is valid during the homing process, the status *word (6041h) bit 13 will be valid, indicating homing error and the motor will stop immediately.*



Mode 5:

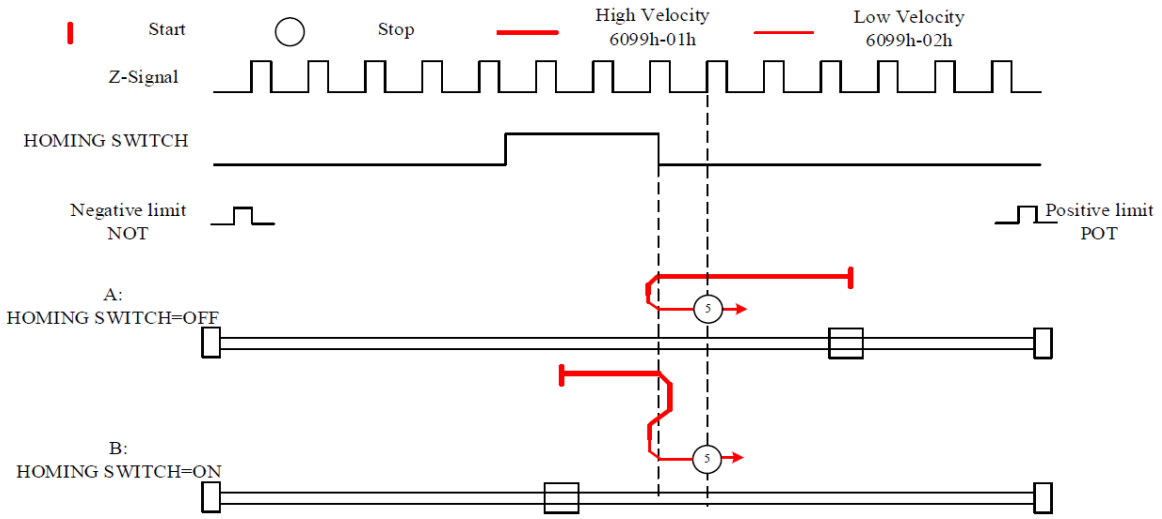
Diagram A: *Homing switch = OFF*

1. Move in negative direction at high velocity until homing switch valid.
2. Move in positive direction at low velocity and stops after homing switch and first encoder Z-signal valid

Diagram B: *Homing switch = ON*

1. Start to move at homing switch position in positive direction at high velocity until after homing switch.
2. Move in negative direction at high velocity until homing switch valid.
3. Move in positive direction at low velocity and stops after homing switch and first encoder Z-signal valid

If the positive/negative limit switch signal is valid during the homing process, the status word (6041h) bit 13 will be valid, indicating homing error and the motor will stop immediately.



Mode 6:

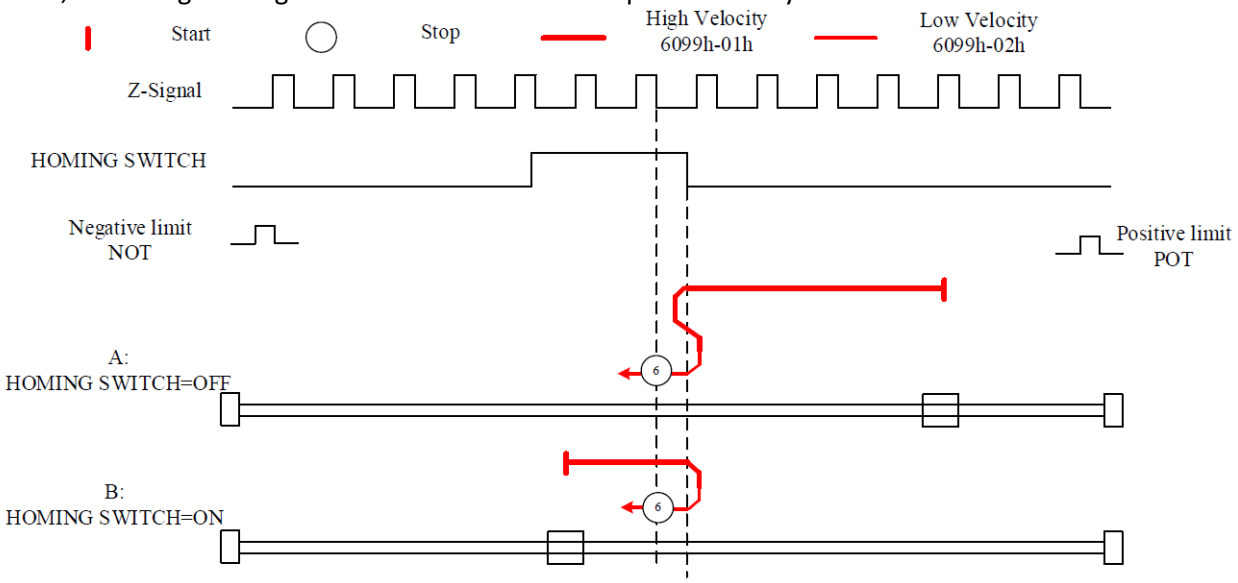
Diagram A: *Homing switch = OFF*

1. Move in negative direction at high velocity until homing switch valid.
2. Move in positive direction at high velocity until homing switch invalid.
3. Move in negative direction at low velocity and stops after homing switch valid andfirst encoder Z-signal valid

Diagram B: *Homing switch = ON*

1. Start to move at homing switch position in positive direction at high velocity until after homing switch.
2. Move in negative direction at low velocity and stops after homing switch valid and first encoder Z-signal valid

If the positive/negative limit switch signal is valid during the homing process, the status word (6041h) bit 13 will be valid, indicating homing error and the motor will stop immediately.



Limit switch signal + homing switch signal + Z-signal mode

Mode 7

Diagram A: *Homing switch & positive limit switch = OFF*

1. Move in positive direction at high velocity until homing switch valid.
2. Move in negative direction at low velocity and stops after homing switch and first encoder Z-signal valid.

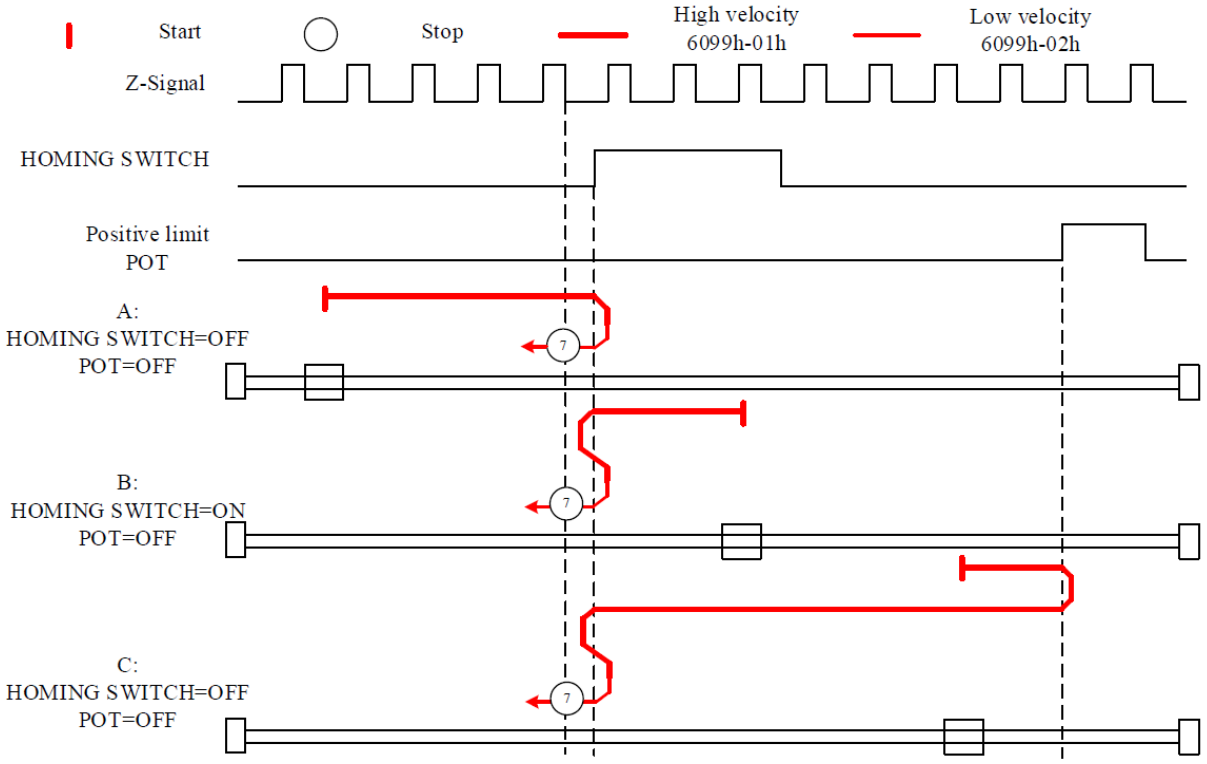
Diagram B: Homing switch = ON, positive limit switch = OFF

1. Start to move at homing switch position in negative direction at high velocity until after homing switch.
2. Move in positive direction at high velocity until homing switch valid.
3. Move in negative direction at low velocity and stops after homing switch and first encoder Z-signal valid

Diagram C: *Homing switch & positive limit switch = OFF*

1. Move in positive direction at high velocity until positive limit switch valid.
2. Move in negative direction at high velocity until after homing switch.
3. Move in positive direction at high velocity until homing switch valid.
4. Move in negative direction at low velocity and stops after homing switch and first encoder Z signal valid

If the negative limit switch signal is valid during the homing process, the status word (6041h) bit 13 will be valid, indicating homing error and the motor will stop immediately.



Mode 8

Diagram A: *Homing switch & positive limit switch = OFF*

1. Move in positive direction at high velocity until homing switch valid.
2. Move in negative direction at high velocity until after homing switch.
3. Move in positive direction at low velocity and stops after homing switch valid and first encoder Z-signal valid.

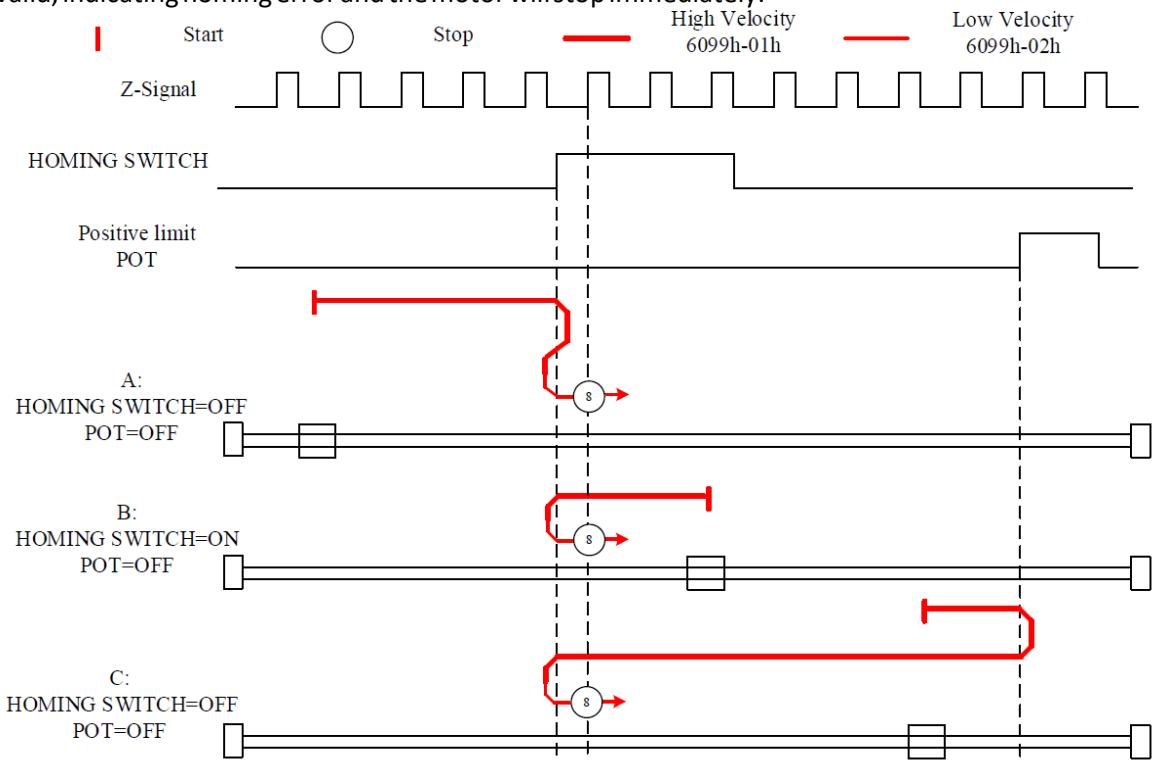
Diagram B: Homing switch = ON, positive limit switch = OFF

1. Start to move at homing switch position in negative direction at high velocity until after homing switch.
2. Move in positive direction at low velocity and stops after homing switch valid and first encoder Z-signal valid

Diagram C: *Homing switch & positive limit switch = OFF*

1. Move in positive direction at high velocity until positive limit switch valid.
2. Move in negative direction at high velocity until after homing switch.
3. Move in positive direction at low velocity and stops after homing switch valid and first encoder Z-signal valid.

If the negative limit switch signal is valid during the homing process, the status word (6041h) bit 13 will be valid, indicating homing error and the motor will stop immediately.



Mode 9

Diagram A: *Homing switch & positive limit switch = OFF*

1. Move in positive direction at high velocity until after homing switch.
2. Move in negative direction at low velocity and stops after homing switch valid and first encoder Z-signal valid.

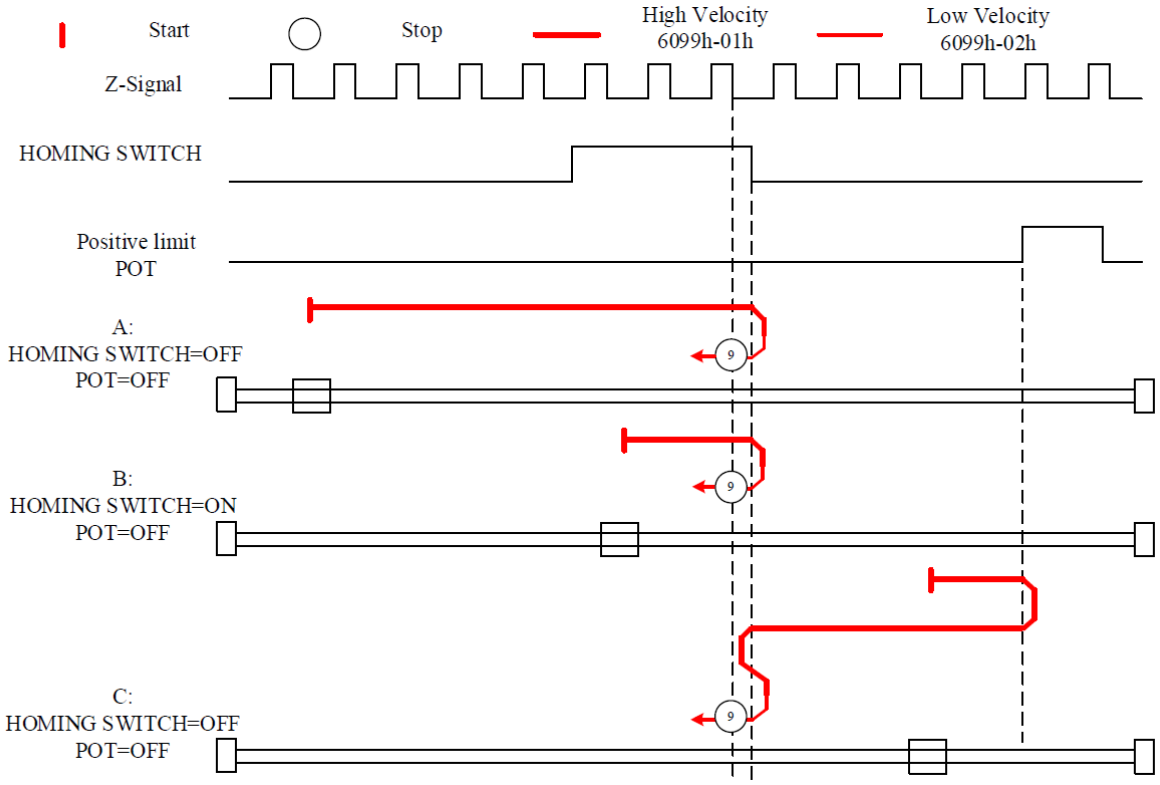
Diagram B: Homing switch = ON, positive limit switch = OFF

1. Start to move at homing switch position in positive direction at high velocity until homing switch invalid.
2. Move in negative direction at low velocity and stops after homing switch valid and first encoder Z-signal valid

Diagram C: *Homing switch & positive limit switch = OFF*

1. Move in positive direction at high velocity until positive limit switch valid.
2. Move in negative direction at high velocity until homing switch valid.
3. Move in positive direction at high velocity until after homing switch.
4. Move in negative direction at low velocity and stops after homing switch valid and first encoder Z signal valid

If the negative limit switch signal is valid during the homing process, the status word (6041h) bit 13 will be valid, indicating homing error and the motor will stop immediately.



Mode 10

Diagram A: *Homing switch & positive limit switch = OFF*

1. Move in positive direction at high velocity until after homing switch.
2. Move in negative direction at high velocity until homing switch valid.
3. Move in positive direction at low velocity and stops after homing switch and first encoder Z-signal valid.

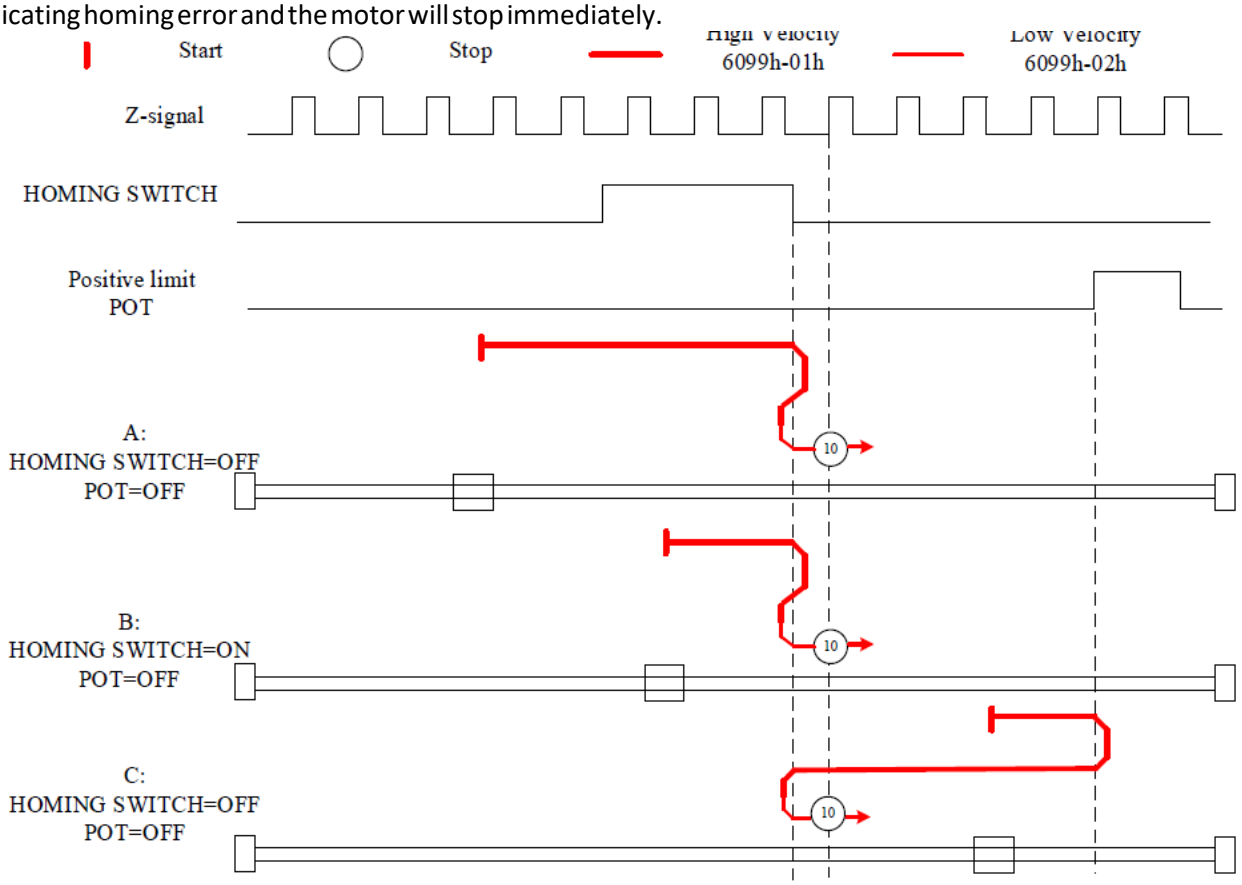
Diagram B: Homing switch = ON, positive limit switch = OFF

1. Start to move at homing switch position in positive direction at high velocity until after homing switch.
2. Move in negative direction at high velocity until homing switch valid.
3. Move in positive direction at low velocity and stops after homing switch and first encoder Z-signal valid

Diagram C: *Homing switch & positive limit switch = OFF*

1. Move in positive direction at high velocity until positive limit switch valid.
2. Move in negative direction at high velocity until homing switch valid.
3. Move in positive direction at low velocity and stops after homing switch and first encoder Z signal valid

If the negative limit switch signal is valid during the homing process, the status word (6041h) bit 13 will be valid, indicating homing error and the motor will stop immediately.



Mode 11

Diagram A: *Homing switch & negative limit switch = OFF*

1. Move in negative direction at high velocity until homing switch valid.
2. Move in positive direction at low velocity and stops after homing switch and first encoder Z-signal valid

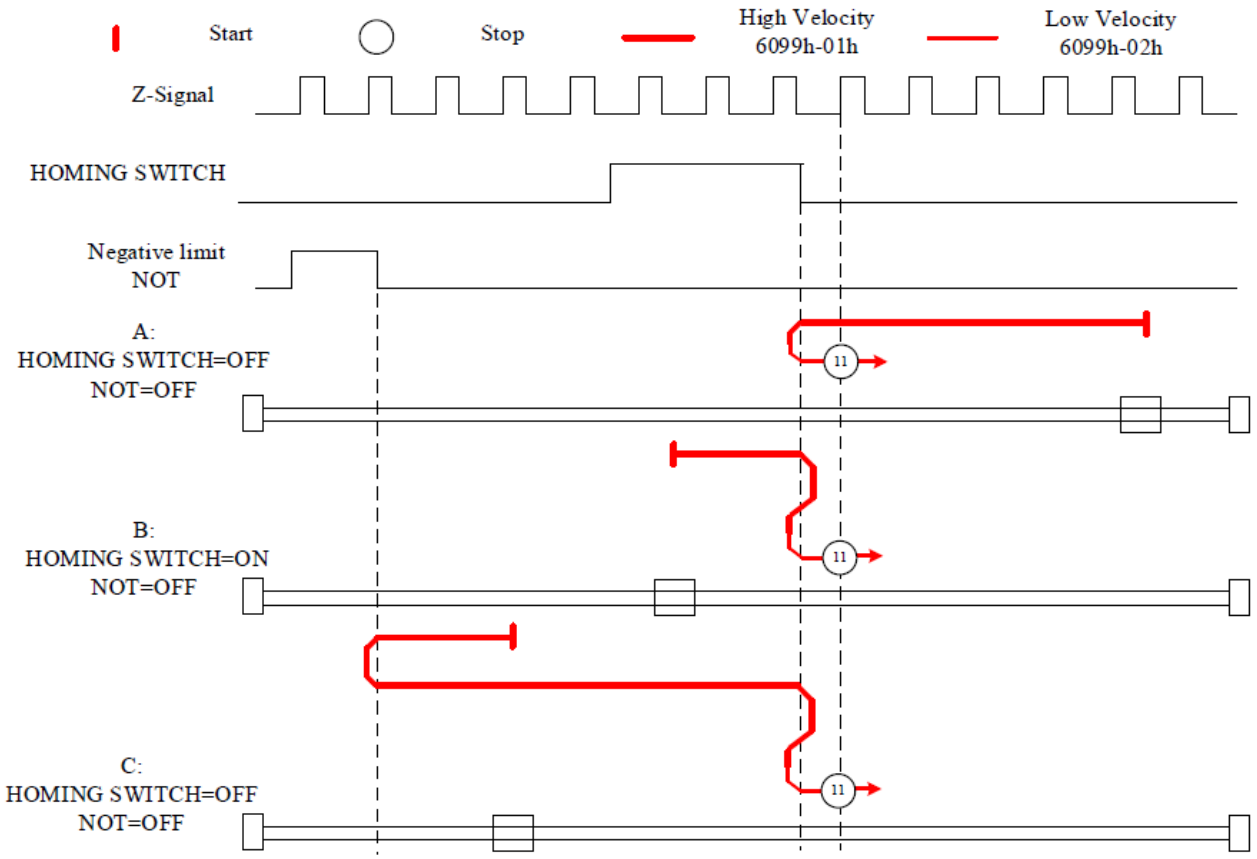
Diagram B: Homing switch = ON, negative limit switch = OFF

1. Start to move at homing switch position in positive direction at high velocity until after homing switch.
2. Move in negative direction at high velocity until homing switch valid.
3. Move in positive direction at low velocity and stops after homing switch and first encoder Z-signal valid

Diagram C: *Homing switch & negative limit switch = OFF*

1. Move in negative direction at high velocity until the negative limit switch valid.
2. Move in positive direction at high velocity until homing switch invalid.
3. Move in negative direction at high velocity until homing switch valid.
4. Move in positive direction at low velocity and stops after homing switch and first encoder Z signal valid

If the positive limit switch signal is valid during the homing process, the status word (6041h) bit 13 will be valid, indicating homing error and the motor will stop immediately.



Mode 12

Diagram A: *Homing switch & negative limit switch = OFF*

1. Move in negative direction at high velocity until homing switch valid.
2. Move in positive direction at high velocity until after homing switch.
3. Move in negative direction at low velocity and stops after homing switch valid and first encoder Z-signal valid

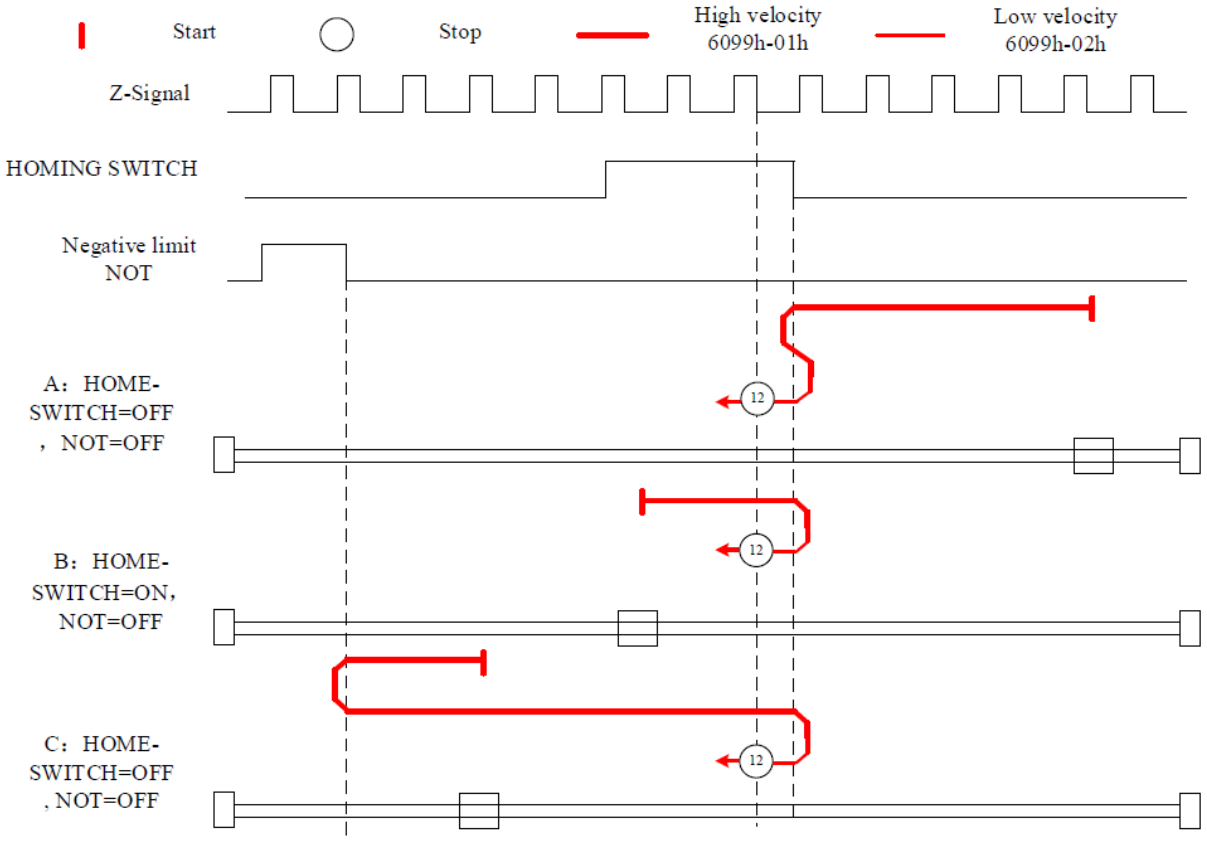
Diagram B: Homing switch = ON, negative limit switch = OFF

1. Move at homing switch position in negative direction at high velocity until after homing switch.
2. Move in positive direction at low velocity and stops after homing switch valid and first encoder Z-signal valid.

Diagram C: *Homing switch & negative limit switch = OFF*

1. Move in negative direction at high velocity until negative limit switch valid.
2. Move in positive direction at high velocity until after homing switch.
3. Move in negative direction at low velocity and stops after homing switch valid and first encoder Z-signal valid.

If the positive limit switch signal is valid during the homing process, the status word (6041h) bit 13 will be valid, indicating homing error and the motor will stop immediately.



Mode 13

Diagram A: *Homing switch & negative limit switch = OFF*

1. Move in negative direction at high velocity until after homing switch.
2. Move in positive direction at low velocity and stops after homing switch valid and first encoder Z-signal valid.

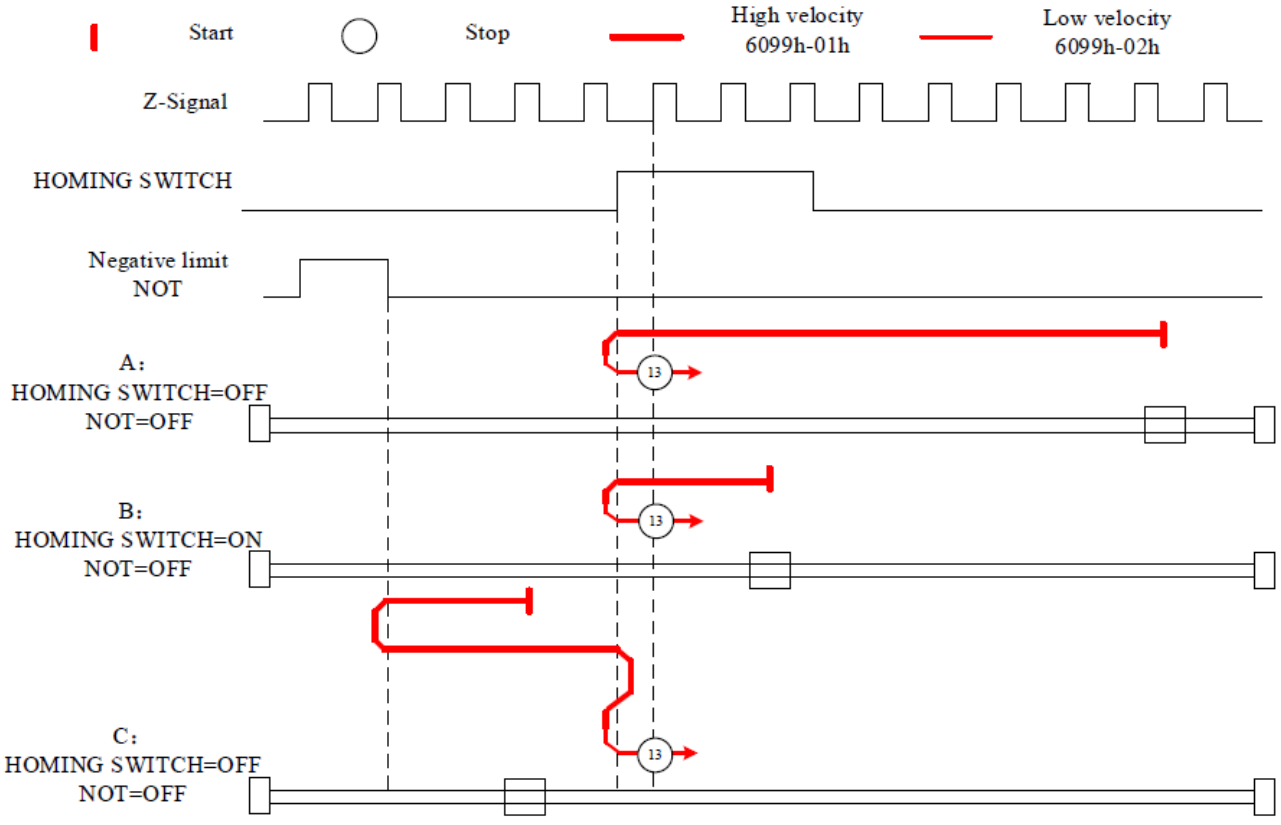
Diagram B: Homing switch = ON, negative limit switch = OFF

1. Start to move at homing switch position in negative direction at high velocity until after homing switch.
2. Move in positive direction at low velocity and stops after homing switch valid and first encoder Z-signal valid.

Diagram C: *Homing switch & negative limit switch = OFF*

1. Move in negative direction at high velocity until negative limit switch valid.
2. Move in positive direction at high velocity until homing switch valid.
3. Move in negative direction at high velocity until after homing switch.
4. Move in positive direction at low velocity and stops after homing switch valid and first encoder Z-signal valid.

If the positive limit switch signal is valid during the homing process, the status word (6041h) bit 13 will be valid, indicating homing error and the motor will stop immediately.



Mode 14

Diagram A: *Homing switch & negative limit switch = OFF*

1. Move in negative direction at high velocity until after homing switch.
2. Move in positive direction at high velocity until homing switch valid.
3. Move in negative direction at low velocity and stops after homing switch and first encoder Z-signal valid.

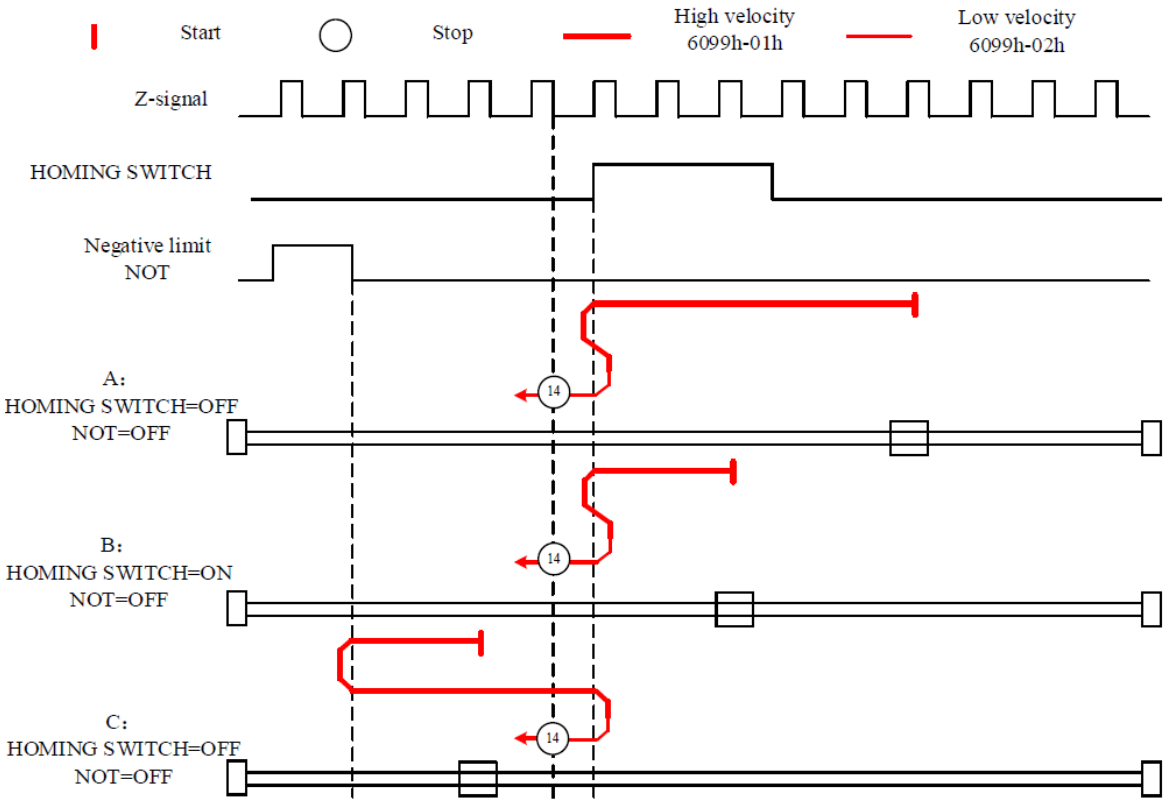
Diagram B: Homing switch = ON, negative limit switch = OFF

1. Start to move at homing switch position in negative direction at high velocity until homing switch invalid.
2. Move in positive direction until homing switch valid.
3. Move in negative direction at low velocity and stops after homing switch and first encoder Z signal valid.

Diagram C: *Homing switch & negative limit switch = OFF*

1. Move in negative direction at high velocity until negative limit switch valid.
2. Move in positive direction at high velocity until homing switch valid.
3. Move in negative direction at low velocity and stops after homing switch and first encoder Z-signal valid.

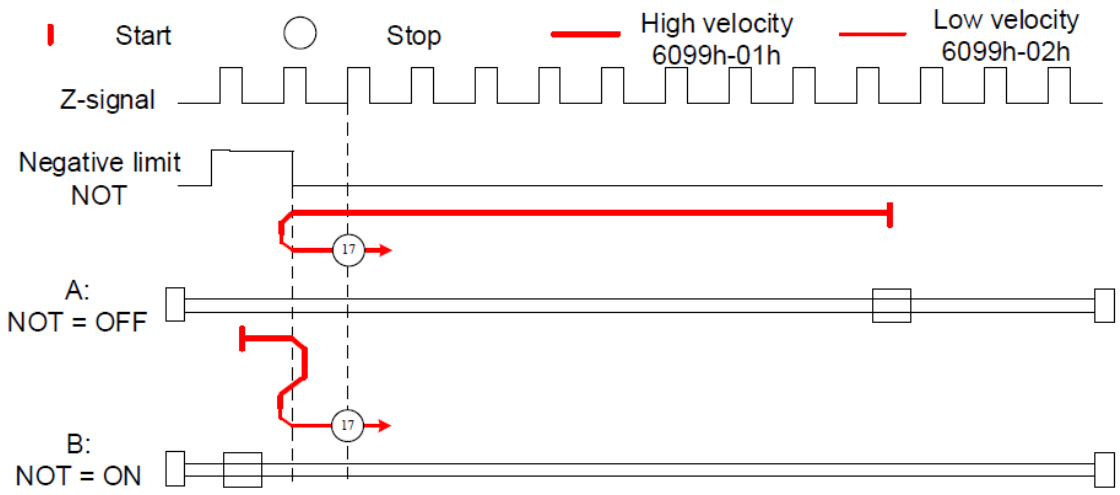
If the positive limit switch signal is valid during the homing process, the status word (6041h) bit 13 will be valid, indicating homing error and the motor will stop immediately.



Limit switch signal triggering detection mode

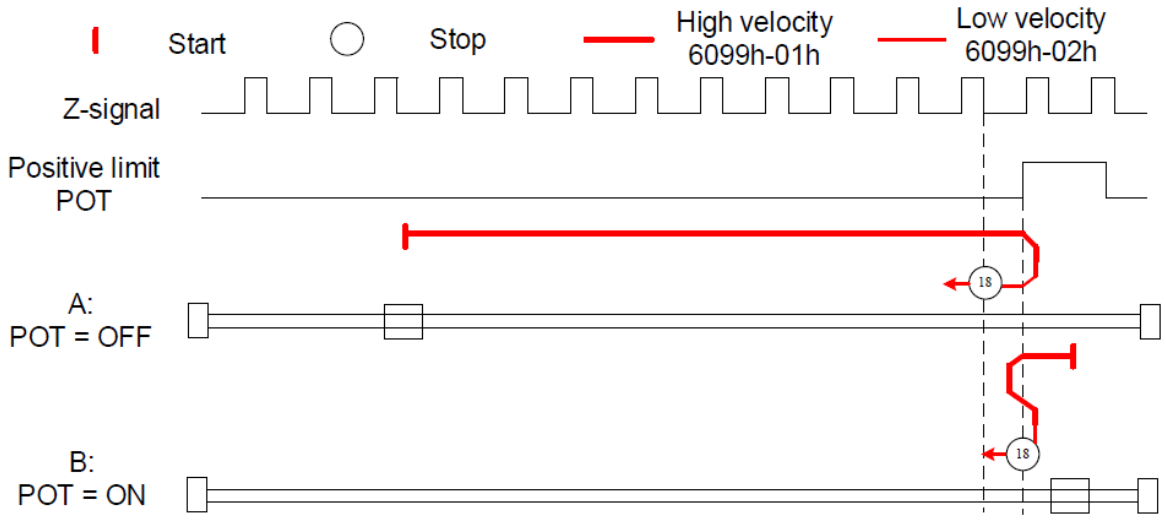
Mode 17：

This mode is similar to mode 1. Only difference is that homing point detection is not through Z-signal but through triggering of negative limit switch signal



Mode 18：

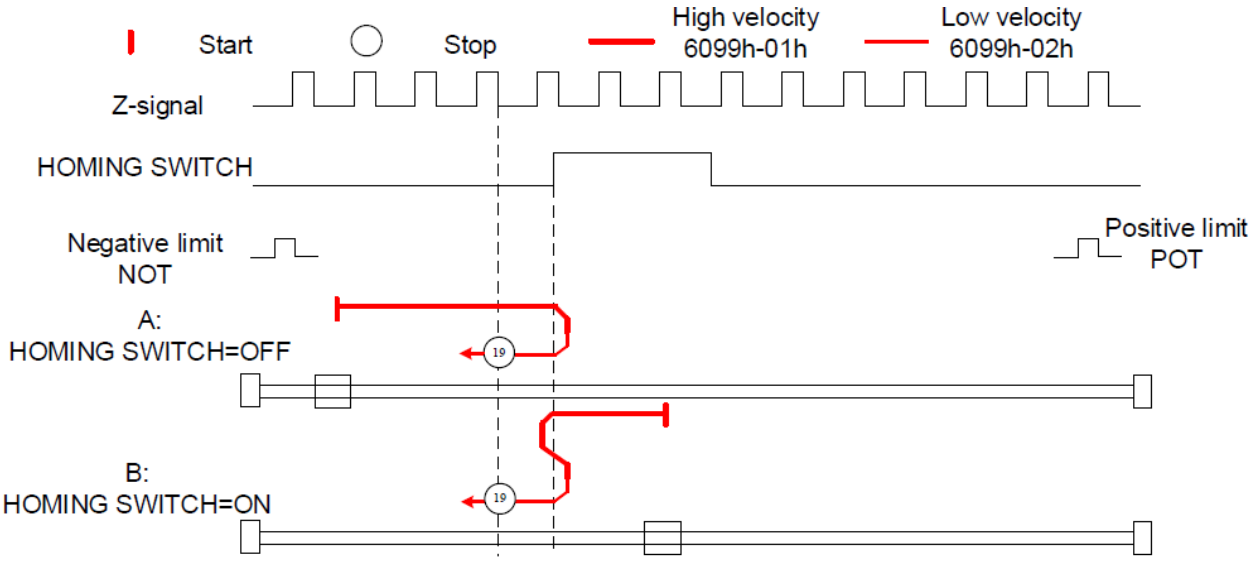
This mode is similar to mode 2. Only difference is that homing point detection is not through Z-signal but through switching of positive limit switch signal



Homing switch signal triggering detection mode

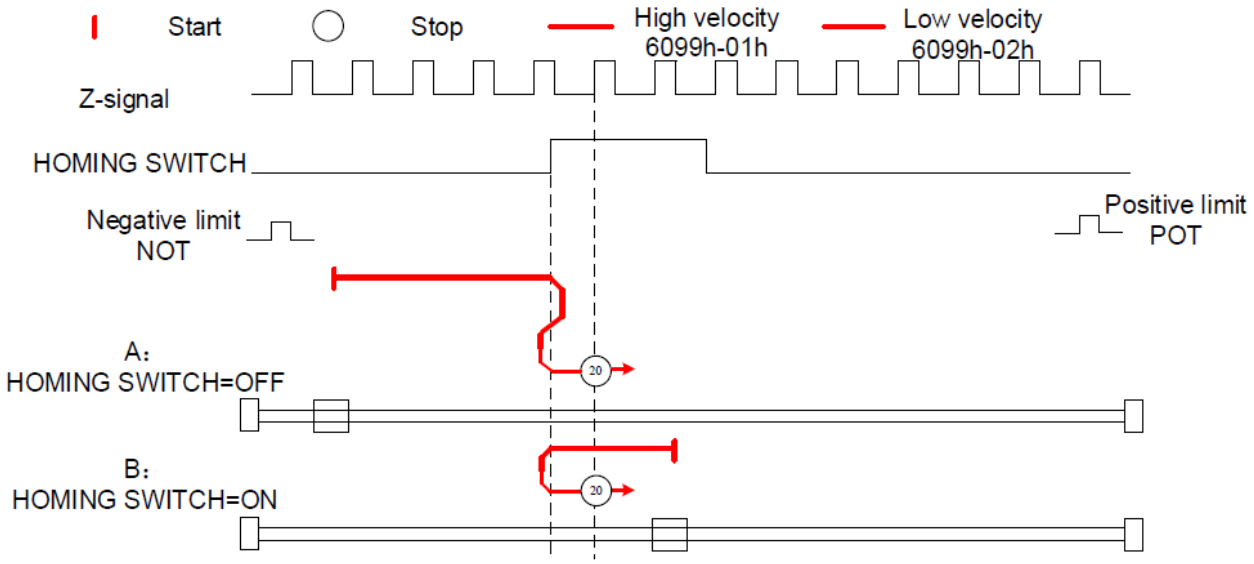
Mode 19:

This mode is similar to mode 3. Only difference is that homing point detection is not through Z-signal but through triggering of homing switch signal



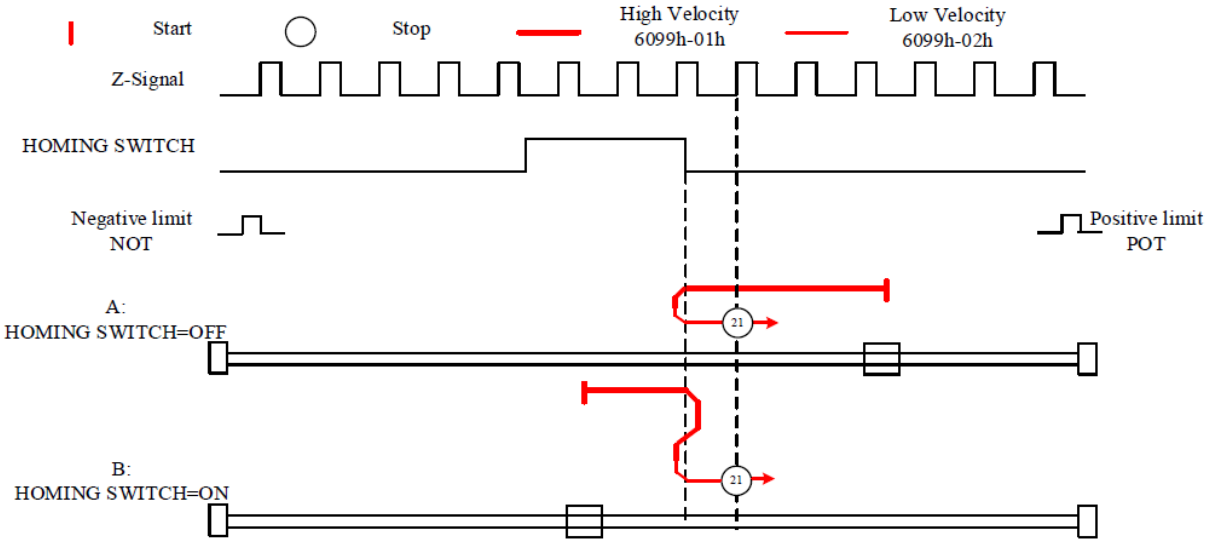
Mode 20:

This mode is similar to mode 4. Only difference is that homing point detection is not through Z-signal but through triggering of homing switch signal



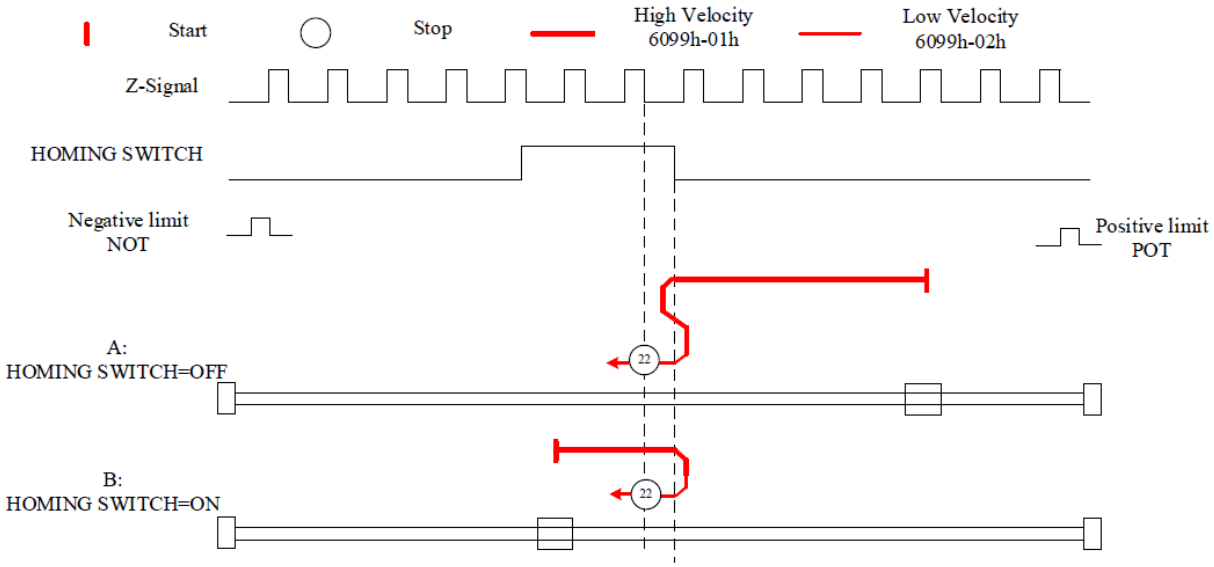
Mode 21:

This mode is similar to mode 5. Only difference is that homing point detection is not through Z-signal but through triggering of homing switch signal.



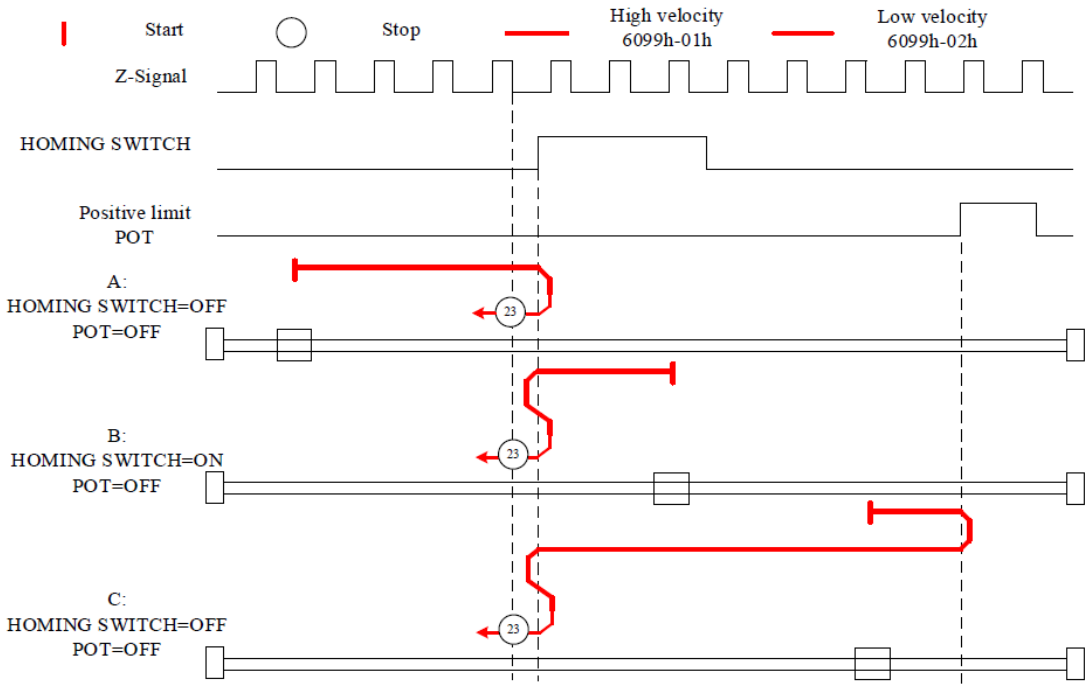
Mode 22:

This mode is similar to mode 6. Only difference is that homing point detection is not through Z-signal but through triggering of homing switch signal.



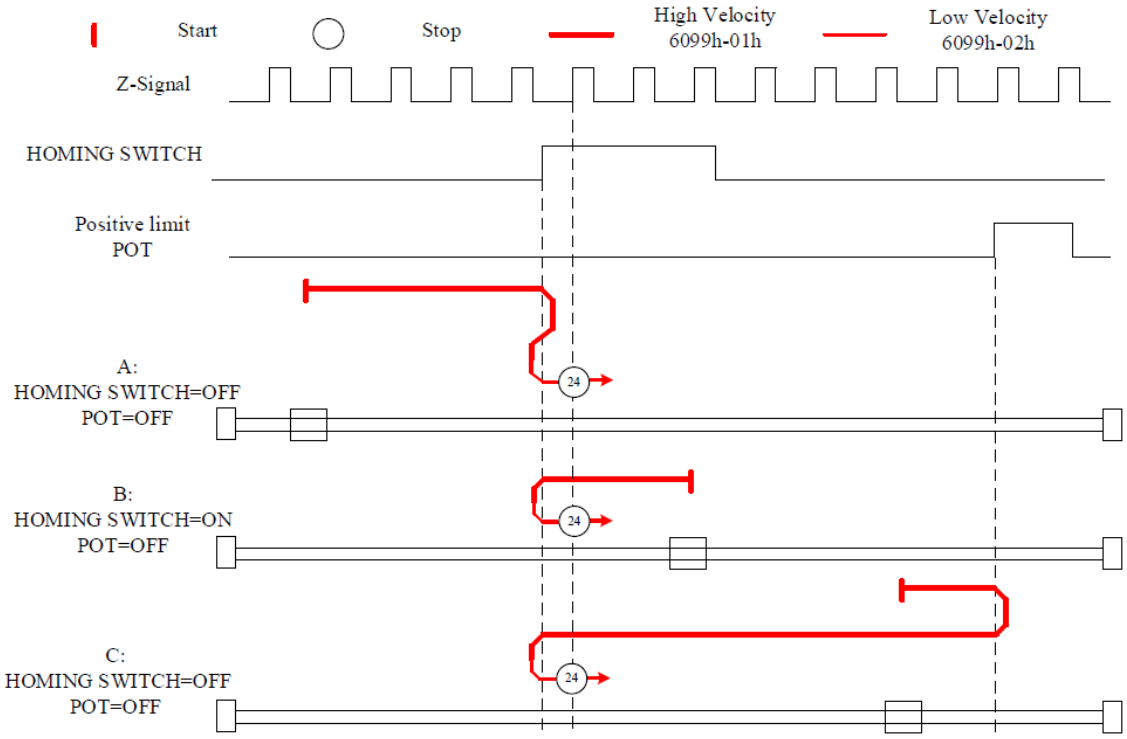
Mode 23:

This mode is similar to mode 7. Only difference is that homing point detection is not through Z-signal but through triggering of homing switch signal.



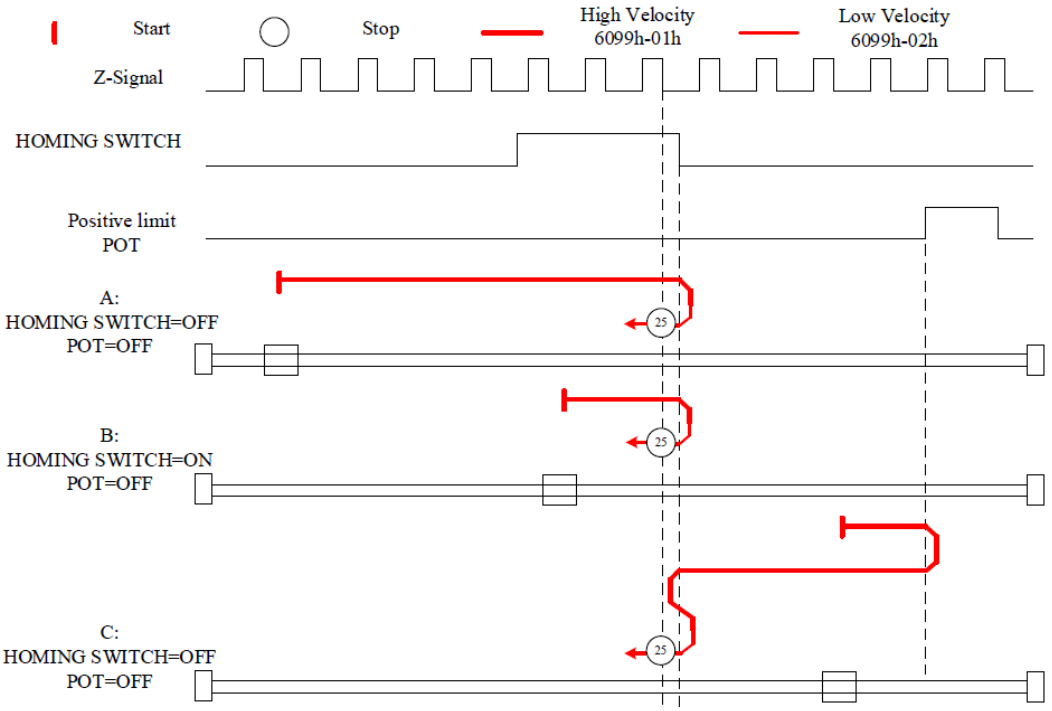
Mode 24:

This mode is similar to mode 8. Only difference is that homing point detection is not through Z-signal but through triggering of homing switch signal.



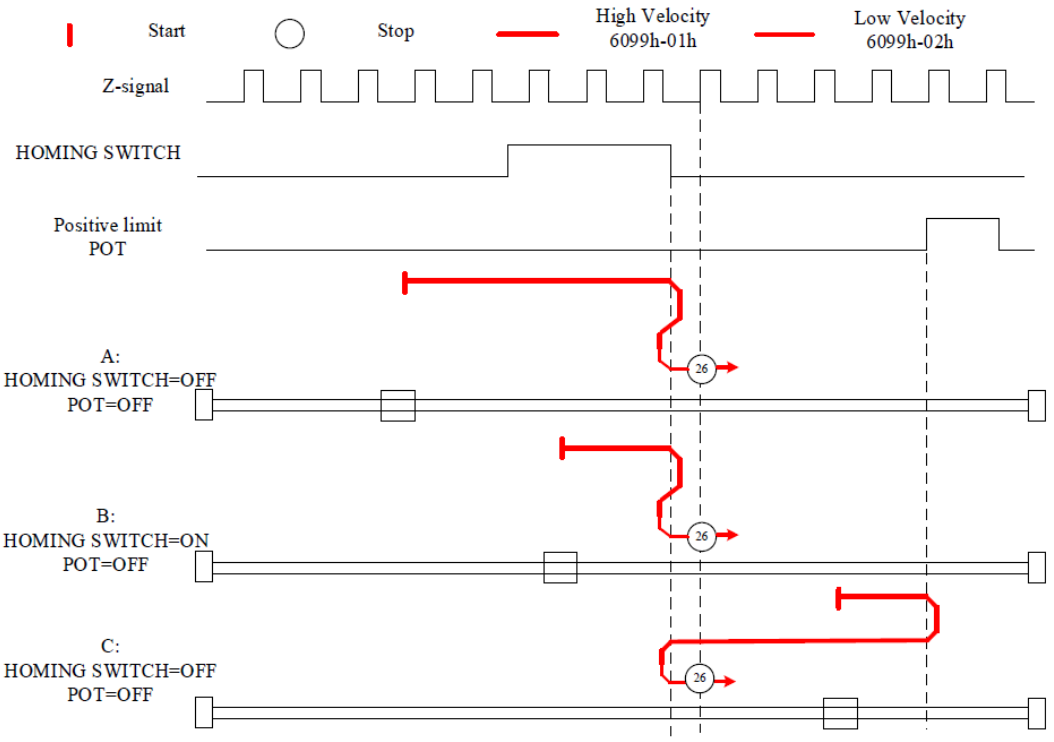
Mode 25：

This mode is similar to mode 9. Only difference is that homing point detection is not through Z-signal but through triggering of homing switch signal



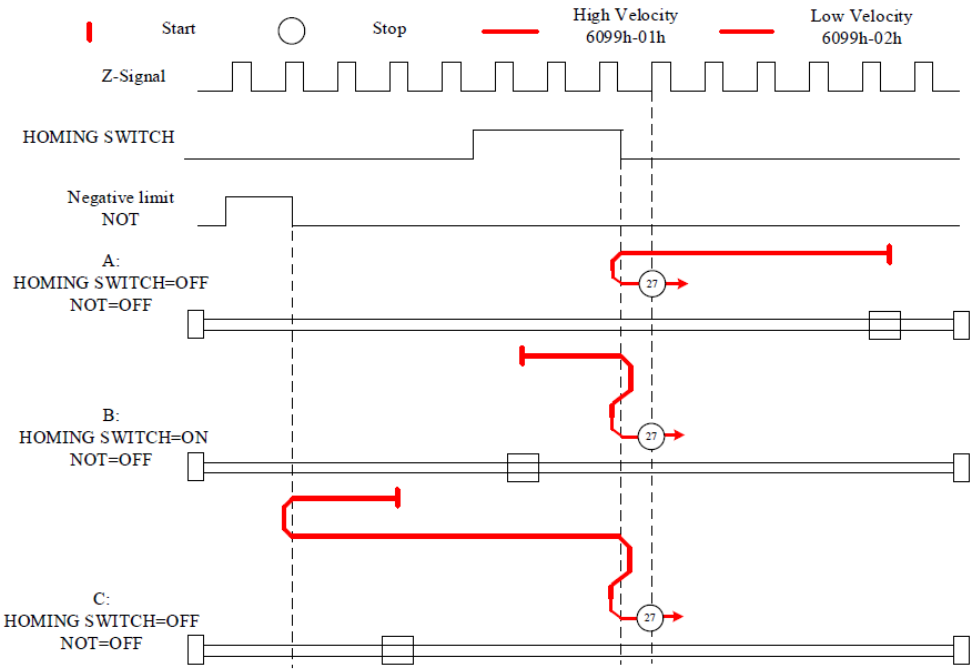
Mode 26：

This mode is similar to mode 10. Only difference is that homing point detection is not through Z-signal but through triggering of homing switch signal



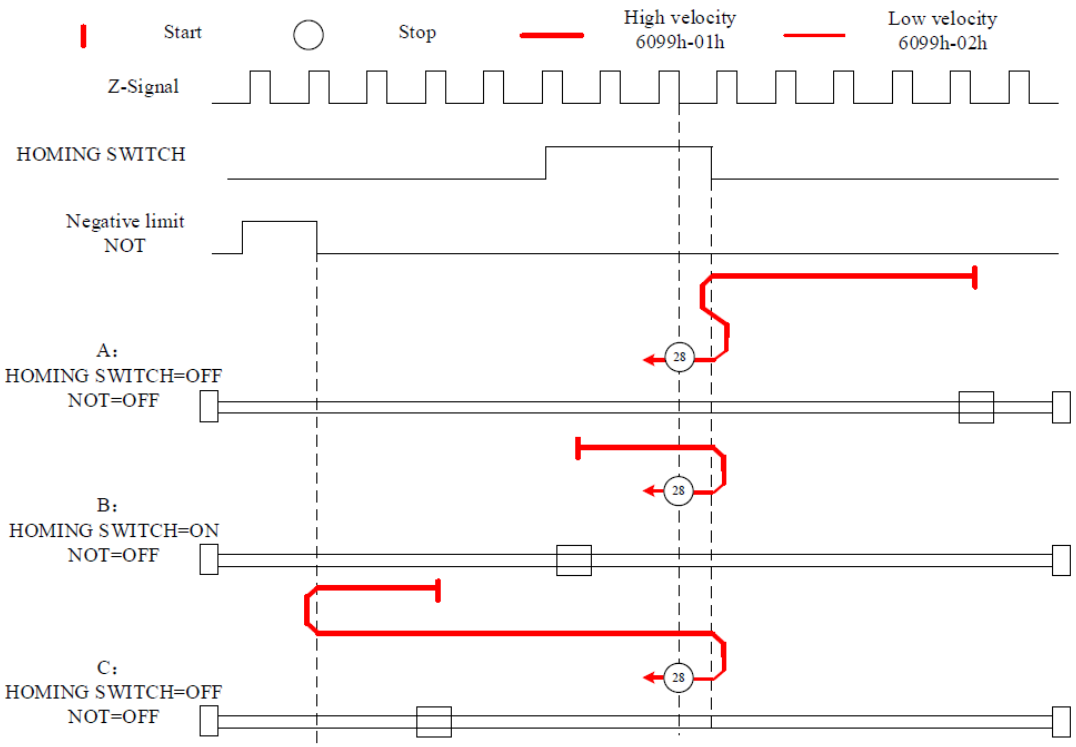
Mode 27：

This mode is similar to mode 11. Only difference is that homing point detection is not through Z-signal but through triggering of homing switch signal



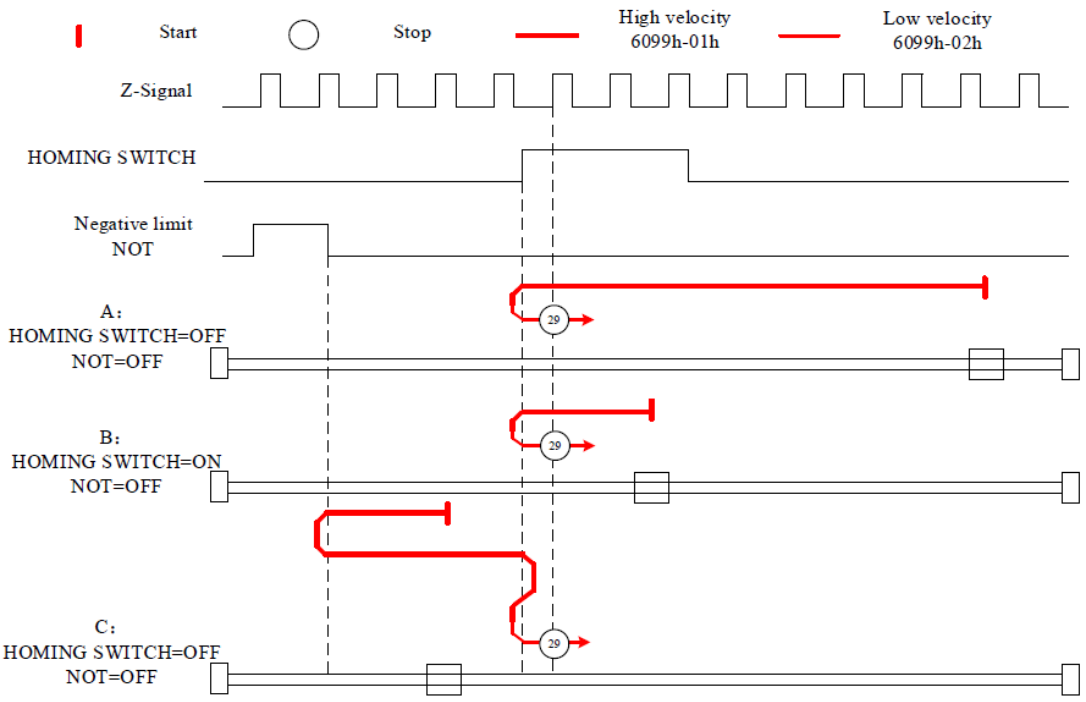
Mode 28：

This mode is similar to mode 12. Only difference is that homing point detection is not through Z-signal but through triggering of homing switch signal



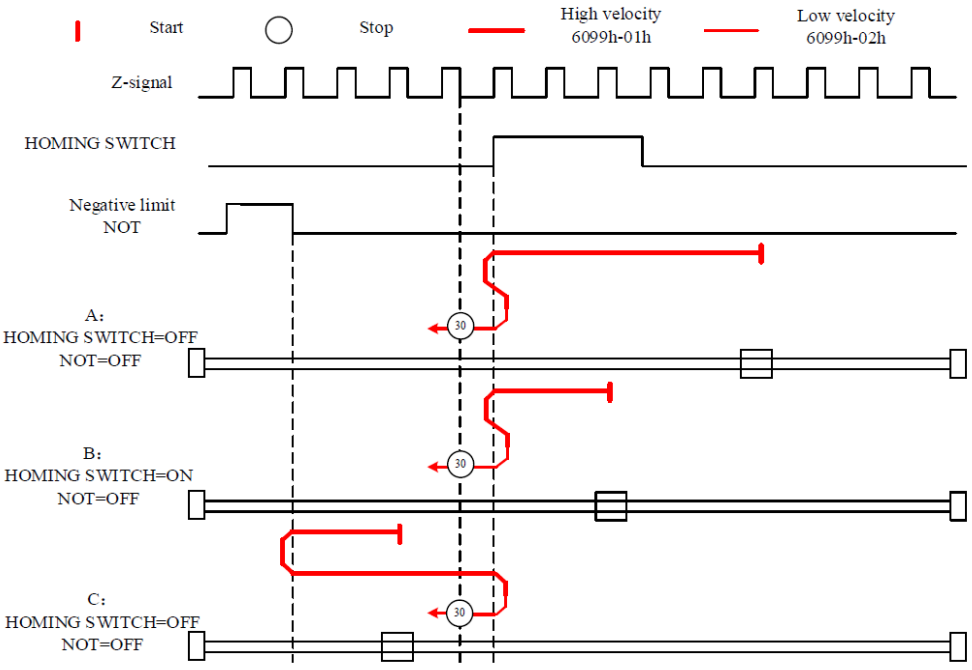
Mode 29：

This mode is similar to mode 13. Only difference is that homing point detection is not through Z-signal but through triggering of homing switch signal



Mode 30：

This mode is similar to mode 14. Only difference is that homing point detection is not through Z-signal but through triggering of homing switch signal

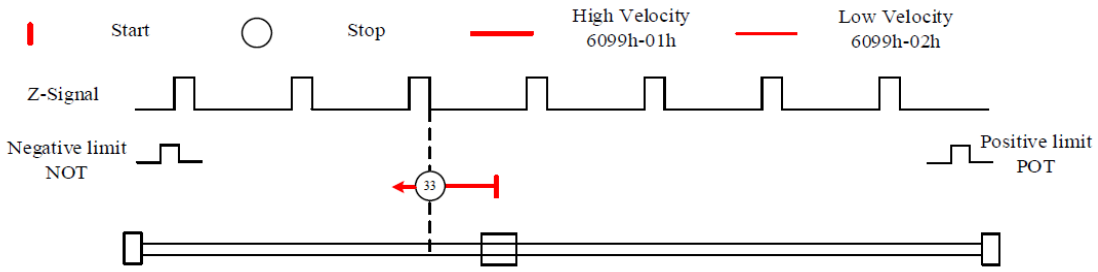


Other modes

Mode 33：

The motor starts to move in negative direction and stops when the Z-signal is valid.

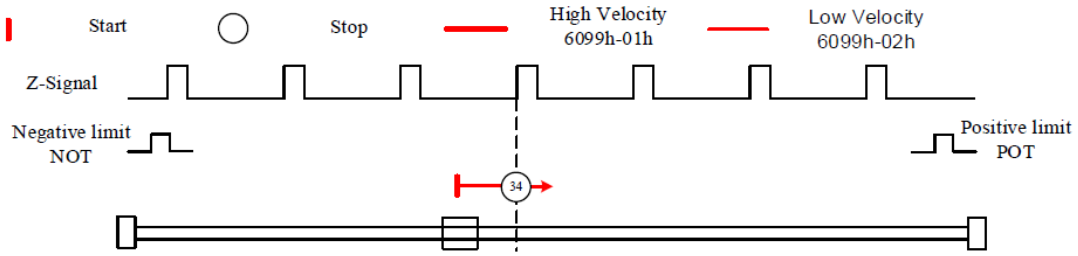
If the positive/negative limit switch signal or homing switch is valid during the homing process, the status word (6041h) bit 13 will be valid, indicating homing error and the motor will stop immediately.



Mode 34：

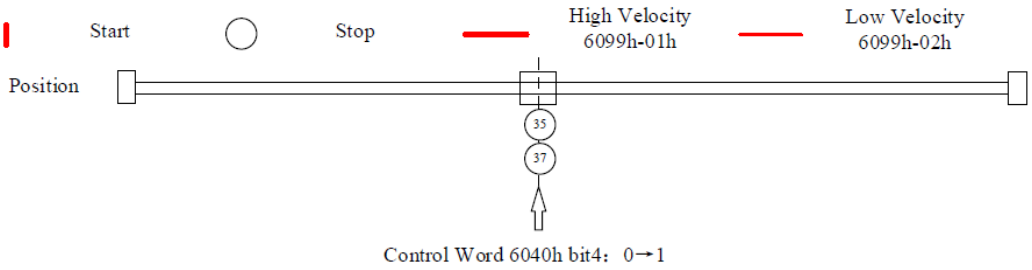
The motor starts to move in positive direction and stops when the Z-signal is valid.

If the positive/negative limit switch signal or homing switch is valid during the homing process, the status word (6041h) bit 13 will be valid, indicating homing error and the motor will stop immediately.



Mode 35/37：

Set the current position as homing point. Using this mode, motor doesn't have to be enabled. Set control word 6040h bit 4 from 0 to 1.



Application: Realization of homing motion

Step 1: 6060h = 6, determine if 6061h = 6. Servo driver is now under HM mode.

Step 2: Write motion parameters: Homing method 6098h, Homing velocity 6099h-01/6099h-02 and acceleration/deceleration 609Ah.

Step 3: Enable servo driver and switch bit 4 from 0 to 1 to start homing motion.

5.6 Velocity Control Mode (CSV, PV)

5.6.1 Common Functions of Velocity Control

Index	Sub Index	Name	Access	PDO	Mode	
					CSV	PV
6040	0	Control word	RW	RxPDO	Yes	Yes
6072	0	Max torque	RW	RxPDO	Yes	Yes
6080	0	Maximum motor velocity	RW	RxPDO	Yes	Yes

5.6.3 Profile Velocity Mode (PV)

In asynchronous motion mode, master device is only responsible for sending motion Parameter s and control commands. OSD-H-*-E servo drive will conduct trajectory planning according to the motion Parameter s sent by master device after receiving the motion start command from the master device. In asynchronous motion mode, the motion between each axes is asynchronous.

PV Block Diagram

The difference between PV and CSV mode is that PV needs OSD-H-*-E to have the function of trajectory generator. The input and output structure of the trajectory generator is shown in figure 7.8

Control Word and Status Word for Profile Velocity Mode

The bit6~4 of control words (6040h) associated with the control mode in PV mode are invalid. The motion in PV mode can be triggered as long as the motion Parameter s (target velocity (60FFh) ACC/DEC (6083h/6084h)) are given after the axis is enabled.

Table7. Bit15~12,10,8 of Status word (6041h) for Profile Velocity Mode

Bit (Label)	Value	Details
8 (Quick stop)	0	Quick stop invalid
	1	Quick stop valid
10 (Velocity reached)	0	Velocity not yet reached

	1	Velocity reached
12 (Zero speed)	0	It's not zero speed. It's moving.
	1	Zero speed or it's going to slow down to zero speed *1)

*1) Zero speed of bit 12 is generally effective when deceleration stop and hardware limit valid.

Application: Realization of profile velocity motion

Step 1: 6060h = 3, determine if 6061h = 3. Servo driver is now under PV mode.

Step 2: Write motion Parameter s: Target velocity 60FFh, acceleration 6083h and deceleration 6084h.

5.7.3 Profile Torque Mode (PT)

In asynchronous motion mode, master device is only responsible for sending motion Parameter s and control commands. OSD-H-*-E servo drive will conduct trajectory planning according to the motion Parameter s sent by master device after receiving the motion start command from the master device. In asynchronous motion mode, the motion between each axes are asynchronous.

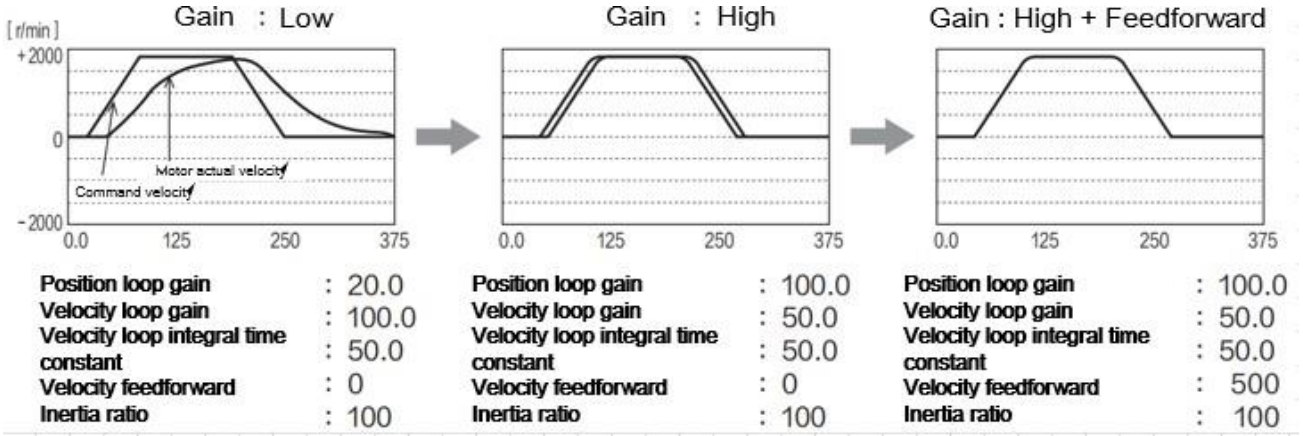
Step 2: Write motion Parameter s: Target torque 6071h, Torque change rate 6087h, and Max. velocity limit 6080h

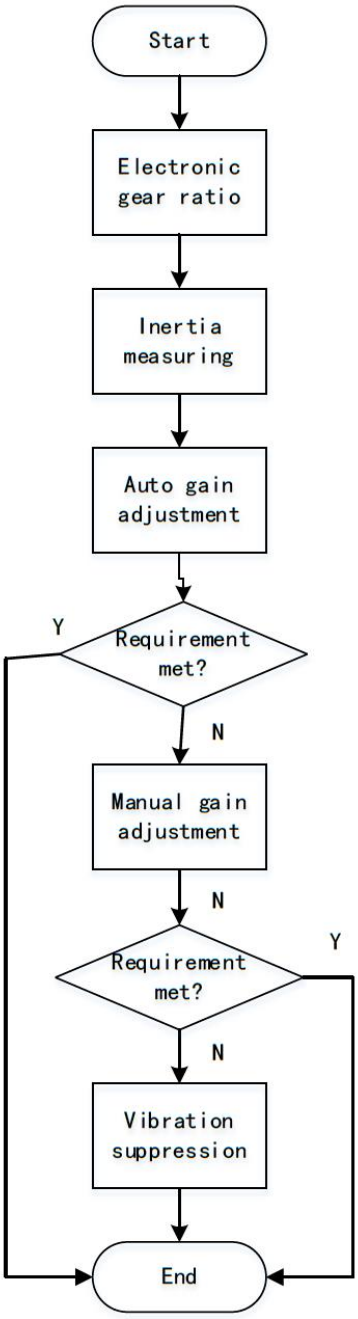
Chapter 6 Application

6.1 Gain Adjustment

In order for servo driver to execute commands from master device without delay and to optimize machine performance, gain adjustment has to be done.



Servo driver gain adjustment is done in combination with a few other Parameter s (Inertia ratio, Position loop gain, Velocity loop gain and Filters settings). These Parameter s will have an effect on each other so it always advisable to tune each Parameter according in order to achieve optimal machine performance. Please refer to the steps below



Steps	Functions	Explanation
Inertia measuring	Online	Motor moves with command from controller, servo driver will automatically calculate load-inertia ratio
	Offline	Using servo driver inertia determining function, servo driver can automatically calculate load-inertia ratio
Auto gain adjustment	Auto gain adjustment	Real time determining of mechanical load, gain value is set accordingly.
Manual gain adjustment	Basic gain	On top of auto gain adjustment, manually adjust related parameter s so that machine can have better responsiveness and following
	Command pulse filter	Set filter for position, velocity and torque command pulse.
	Gain feedforward	Enable feedforward function to improve following behavior
Vibration suppression	Mechanical resonance	Using notch filtering function to suppress mechanical resonance.

6.2 Inertia measuring function

Inertia ratio = Total mechanical load rotational inertia / Electronic gear rotational inertia ratio is an important Parameter. Setting a suitable value can help with the precise tuning of the servo system. Inertia ratio can be set manually and also be determined automatically through servo driver

6.2.1 Online inertia determination

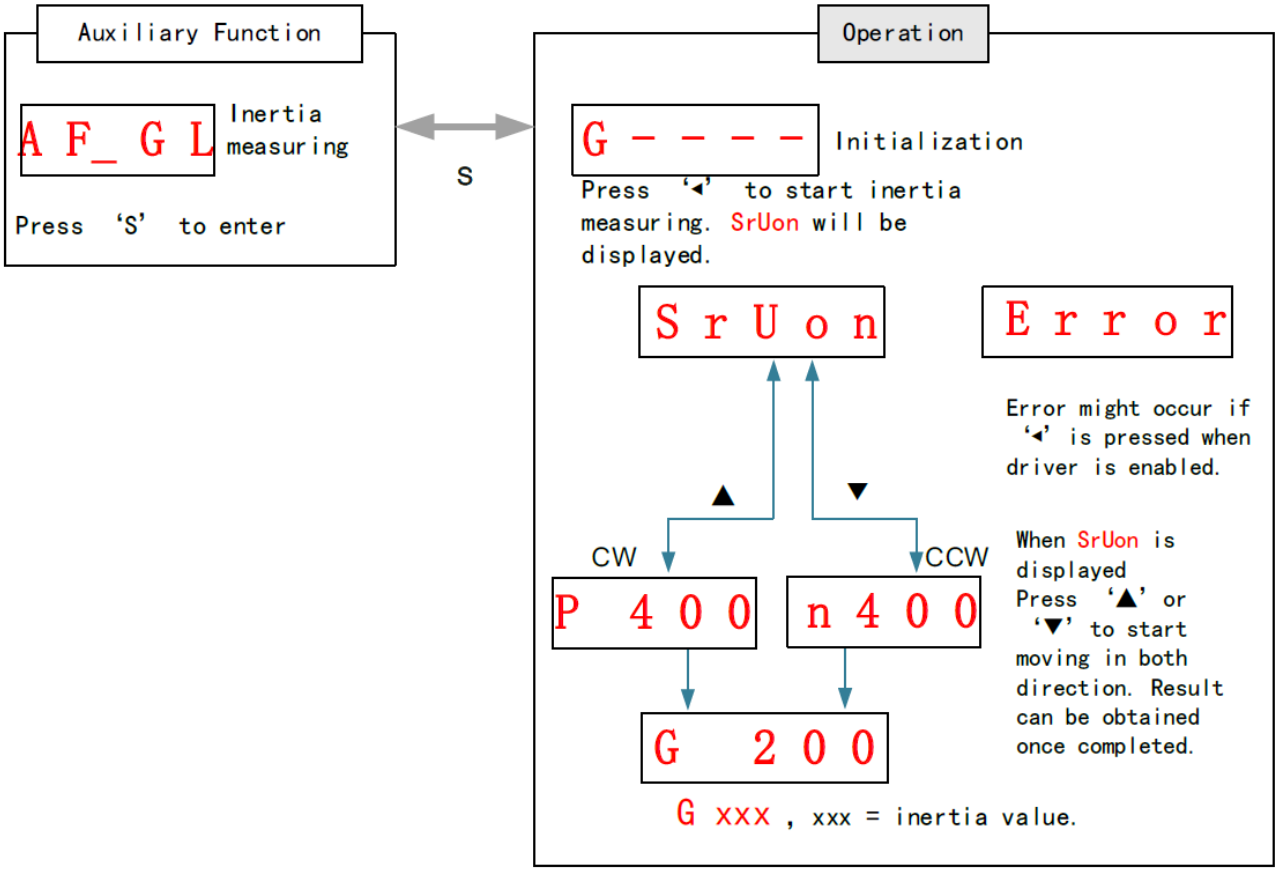
Enable motor using controller. Let motor run at above 400rpm, make sure there are acceleration, constant velocity and deceleration phase during the whole run. Cycle through 2-3 times to calculate load-inertia ratio. Result can be found on the front Panel d16 or through Optimus Tuning Software system monitoring Page. Enter the calculated value into Pr0.04 and save.

6.2.2 Offline inertia determination

Can be achieved through driver front Panel or on Optimus Tuning Software . Please make sure:

1. Servo driver is disabled.
2. Axis is within safe and allowed range and limit switch is not triggered prevent axis from over travelling.

6.2.3 Auxiliary function to determine inertia on front Panel



Steps:

1、Set the trial run velocity PR6.04. Value set shouldn't be too large, please keep it at around 400 r/min.

2、Enter AF_GL for auxiliary function – Inertia ratio determination into front Panel 3、Press S once to enter. "G--" will be displayed on the front Panel.

4、Press ◄ once to display "StUon"

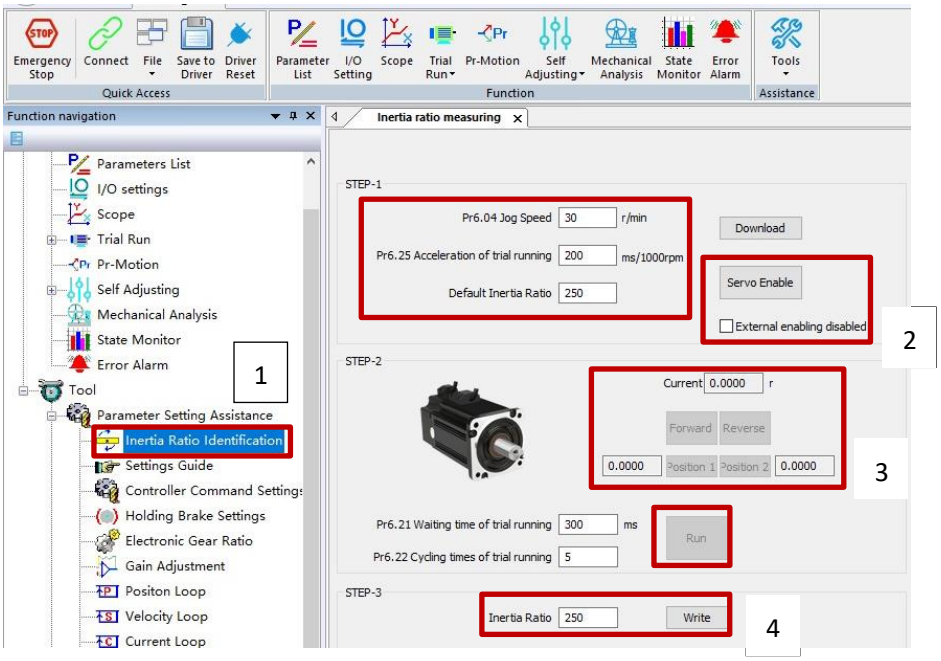
5、Press ▲ or ▼ once to start to calculate the inertia.

6、After the calculation is done, G xxx will be displayed and xxx is the value of inertia calculated.

7、Write the corresponding value into Pr0.04. Please refer to for Parameter saving on servo driver.

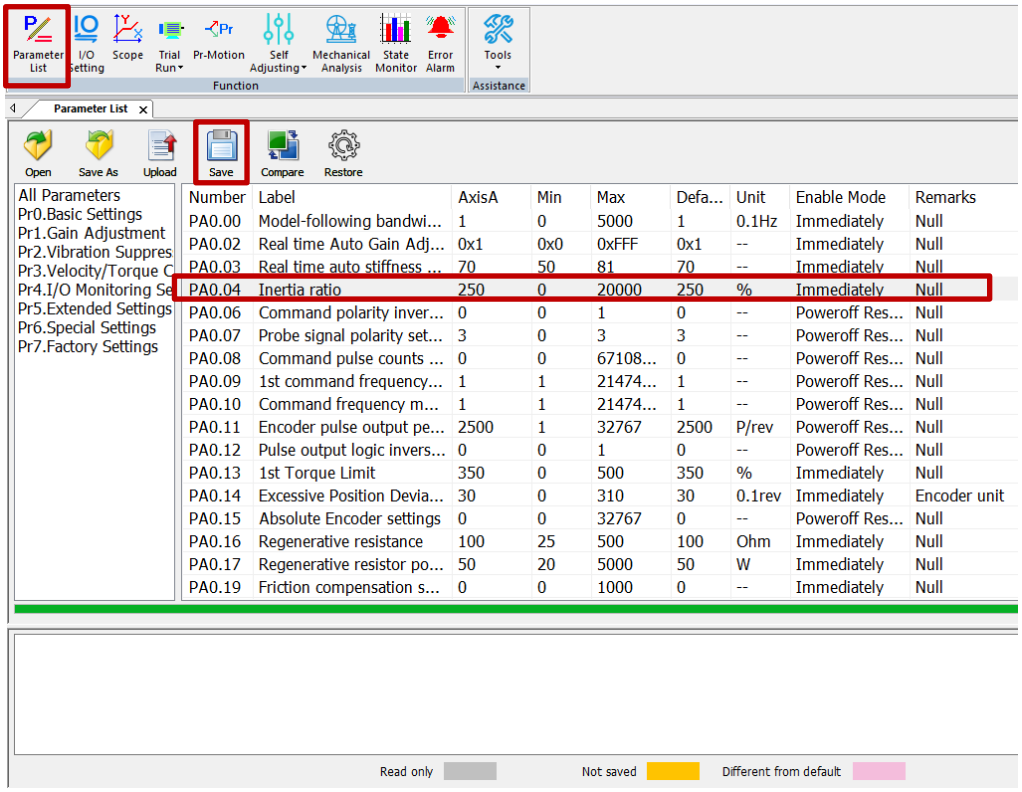
6.2.4 Inertia measuring using Optimus Tuning Software

1. Start Optimus Tuning Software and maneuver to inertia ratio identification Page under performance tuning. Set trial run velocity Pr6.04 and acc-/deceleration time PR6.25, click on 'Upload' to upload Parameter s to servo driver.
2. Tick "Prohibit external enabling" and click on "servo on".
3. Click and hold "CCW" to start the motor. Current position will show motor cycles of revolution. Click on POS 1 to save current position as starting point. Click and hold "CW" to start the motor again. Click on POS 2 to save current position as ending point.
4. Set the waiting time between each cycle in Pr6.21 and no. of cycles in Pr6.22. Click on 'Run' and motor will run according to the Parameter s set.



5. After the calculation is done, inertia ratio will be calculated automatically and click on 'write' to enter the calculated value into Pr0.04.
6. Click on "Parameter List" to enter Parameter s management to check or modify Pr0.04. Then, click on "Save" to save Parameter s to driver.

7.



Please take note:

1. *Trial run velocity and distance should be optimal to prevent any axis from bumping into objects.*
2. *It is recommended to move only in 1 direction for vertically mounted axis. Take precaution before moving the axis.*
3. *For applications with higher frictional drag, please set a minimal travel distance.*

PR0.04	**Label**	Inertia ratio	**Mode**	**F**		
	Range	0~20000	**Default**	250	**Unit**	%
	Activation	Immediate			**Index**	2004h

PR0.04= (load inertia/motor rotational inertia) ×100%

Set inertia ratio according to actual load inertia. When both are uniform, actual motor velocity loop responsiveness and gain settings will be consistent. If inertia ratio is greater than actual value, velocity loop gain settings will be higher and vice versa.

For motor with high inertia, PR0.04 can be left unfilled but optimal setting of PR0.04 could improve system performance.

6.3 Auto gain adjustment

This function will measure real time mechanical properties and set gain values in accordance to mechanical stiffness. Can be used in any control mode

Conditions to implement	
ıtrol mode	Please refer to PR0.02 for detailed explanations. Auto gain adjustment is different for each control mode.
ıer	・Servo driver needs to be enabled ・Set up input signals such as deviation counter clearing and command input; Torque limit and other motion control Parameter s to enable motor to move normally without obstacles.

Under certain conditions, external factors might affect automatic gain adjustment functions. If the conditions as listed exist or unfavorable, please disable the automatic gain adjustment function.

Affecting conditions	
Load inertia	・If inertia is less than 3 times or over 20 times of rotor inertia. ・Changes in load inertia
Load	・Very low mechanical stiffness ・If gear backlash is a non-linear property
Motion	・Velocity less than 100r/min or continuously in low velocity mode ・Acc-/deceleration to 2000r/min within 1s. 。 ・Acc-/deceleration torque lower than eccentric load, frictional torque. ・Velocity < 100r/min, acc-/deceleration to 2000r/min within 1s but not longer than 50ms

To enable automatic gain adjustment:

1. Disable the servo driver.
2. Set PR0.02 = 0x01/0x11 or 0x02/0x12. Then, set PR0.03
3. Servo enabled. Run motion as normal to start measuring load properties. Related Parameter s will be automatically set.
4. Increase motor responsiveness by increasing PR0.03. Please check if there is any vibration before setting PR0.03 to max. value.
5. Save the Parameter s.

Please take note:

- *Please stop the motor before modifying any Parameter. PR0.02 only takes effect after saving modified Parameter values into EEPROM and restarting the driver.*

After enabling the servo driver for the first time or when increasing PR0.03, *mechanical noise or vibration might occur for the first run, it is normal. If it persists, please set PR0.03 to lower value.*

Parameter s that changes in accordance to real time gain adjustment

No.	Parameter	Label	Remarks
1	PR1.00	1st position loop gain	When stiffness setting is valid, Parameter s will be updated to match stiffness value
2	PR1.01	1st velocity loop gain	
3	PR1.02	1st velocity integral time constant	
4	PR1.03	1st velocity detection filter	
5	PR1.04	1st torque filter	
6	PR1.05	2nd position loop gain	
7	PR1.06	2nd velocity loop gain	
8	PR1.07	2nd velocity integral time constant	
9	PR1.08	2nd velocity detection filter	
10	PR1.09	2nd torque filter	

If auto gain adjustment is valid, the Parameter s listed above can't be manually modified. Only when PR0.02 = 0x00 or 0x10, can the gain related Parameter s be modified manually.

Gain related Parameter s that don't change with the real time gain adjustment

No.	Parameter	Label
1	PR1.10	Velocity feedforward gain constant
2	PR1.11	Velocity feedforward filter time constant
3	PR1.12	Torque feedforward gain
4	PR1.13	Torque feedforward filter time constant
5	PR1.15	Position control gain switching mode
6	PR1.17	Position control switching level
7	PR1.18	Position control switching hysteresis
18	PR1.19	Position gain switching time

PR0.02	Label	Real time Auto Gain Adjusting	Mode	F		
	Range	0x0~0xFFF	Default	0x001	Unit	—
	Activation	Immediate			Index	2002 h
Set up the mode of the real time auto gain adjusting.						

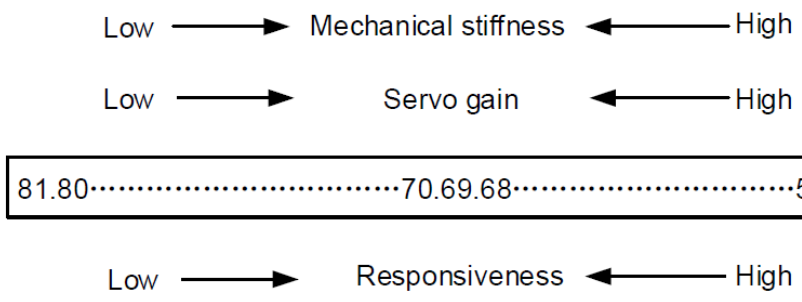
Data bits	Category	Settings	Application
0x00_	Motion setting mode	Used to set motion setting mode, which can be selected according to the motion characteristics or setting requirements. Generally, it is recommended to select mode 1 with good generality when there is no special requirement, mode 2 when rapid positioning is needed If mode 1 and mode 2 cannot meet the requirements, please choose mode 0.	
		0: Manual	PR0.03 invalid. Gain value must be adjusted manually and accordingly.
		1: Standard	PR0.03 valid. Quick gain adjusting can be achieved by changing PR0.03 stiffness value. Gain switching is not used in this mode, suitable for applications with requirements for stability.

		2: Positioning	PR0.03 valid. Quick gain adjusting can be achieved by changing PR0.03 stiffness value. This mode is suitable for applications requiring quick positioning. Not recommended for load mounted vertical to ground, or please compensate for the load using PR6.07
0x0_0	Load type setting	Used to select the load type, choose according to load-inertia ratio and mechanical structure.	
		0: Rigid structure	This mode prioritizes system responsiveness. Use this mode when there is a relatively rigid structure with low load inertia. Typical application including directly connected high-precision gearbox, lead screw, gears, etc.
		1: High inertia	For applications with higher load inertia (10 times or above), gain settings take into account both machine stability and responsiveness. Not recommended to set stiffness above 15 for high load inertia.
		2: Flexible structure	This mode prioritizes system stability. Use this mode when there is low rigidity structure with high load inertia. Typical applications included belts and chains.
0x_00	*Reserved*		

The setting type combination is a hexadecimal standard, as follows:	
0X000	Rigid structure + Manual
0X001	Rigid structure +Standard
0X002	Rigid structure +Positioning
0X010	High inertia + Manual
0X011	High inertia + Standard
0X012	High inertia + Positioning
0X020	Flexible structure + Manual
0X021	Flexible structure +Standard
0X022	Flexible structure +Positioning

PR0.03	**Label**	Real time auto stiffness adjusting	**Mode**	**F**		
	Range	50 ~ 81	**Default**	70	**Unit**	—
	Activation	Immediate			**Index**	2003h

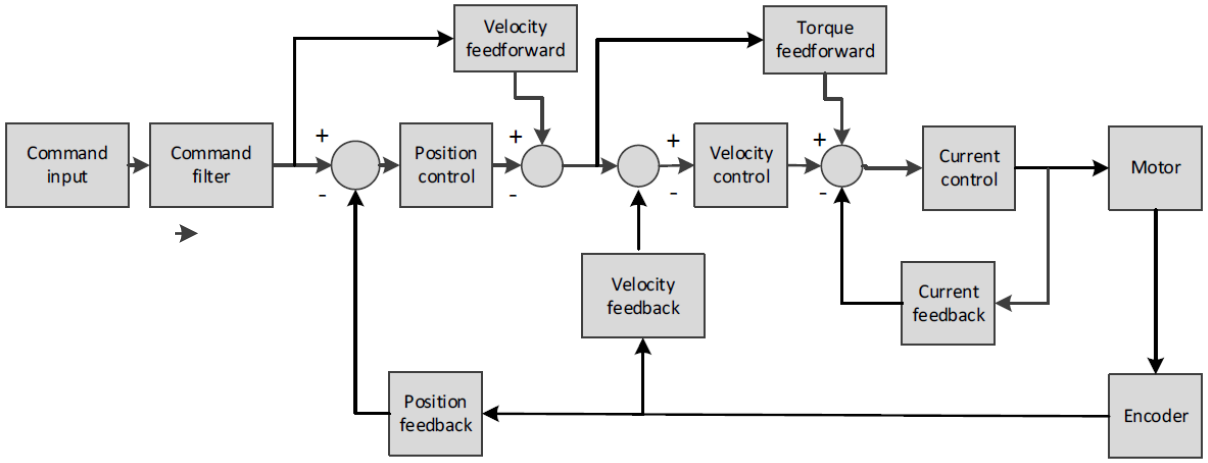
Valid when PR0.03 = 1,2



- Lower values ensure better system responsiveness and mechanical stiffness but machine vibration might occur, please set accordingly. Please stop the motor before doing any changes to the stiffness settings.
- When PR0.02 = 0x010, please set stiffness level to around 65.

6.4 Manual gain adjustment

Due to limitation of load conditions, automatic gain adjustment might not achieve expected performance. Control can be improved through manual gain adjustment The servo system is made up of 3 control loops. From outer to inner: position loop, velocity loop, current loop as shown in the diagram below.



Inner control loop demands higher responsiveness. In order to avoid system instability, please tune in accordance to this principle. Current loop gain usually satisfies the responsiveness demand without tuning. When gain adjustment is done under position control mode, in order to keep the system stabile, position and velocity loop gain have to be increased at the same time to make sure the responsiveness of the position loop is lower than velocity loop.

Steps to tuning (Position and velocity control)

For servo gain, if any one of the Parameter s is changed, please modify other gain related Parameter s accordingly. Make sure to the change at around 5% and follow the rules as below.

1) Increase responsiveness
a) Reduce torque command filter time
b) Increase velocity loop gain
c) Decrease velocity loop integral time
d) Increase position loop gain
2) Decrease responsiveness, prevent vibration and over shoot
a) Reduce position loop gain
b) Increase velocity loop integral time
c) Reduce velocity loop gain
d) Increase torque filter time

PR1.00	Label	1st position loop gain	Mode	PP	HM	CSP
	Range	0~30000	Default	320	Unit	0.1/s
	Activation	Immediate			Index	2100h

Higher position loop gain value improves the responsiveness of the servo driver and lessens the positioning time.

Position loop gain value shouldn't exceed responsiveness of the mechanical system and take in consideration velocity loop gain, if not it might cause vibration, mechanical noise and overtravel.

As velocity loop gain is based on position loop gain, please set both values accordingly.

Recommended range: 1.2≤PR1.00/PR1.01≤1.8

PR1.02	Label	1st Integral Time Constant of Velocity Loop	Mode	F		
	Range	1~10000	Default	310	Unit	0.1ms
	Activation	Immediate			Index	2102h

If auto gain adjusting function is not enabled, PR1.02 is activated.

The lower the set value, the closer the lag error at stop to 0 but might cause vibration. If the value set is overly large, overshoot, delay of positioning time duration and lowered responsiveness might occur.

Set 10000 to deactivate PR1.02.

Recommended range: 50000≤PR1.01xPR1.02≤150000

For example: Velocity loop gains PR1.01=500(0.1Hz), which is 50Hz. Integral time constant of

velocity loop should be 100(0.1ms) ≤PR1.02≤300(0.1ms)

PR1.04	Label	1st Torque Filter Time Constant	Mode	F		
	Range	0~2500	Default	126	Unit	0.01ms
	Activation	Immediate			Index	2104h

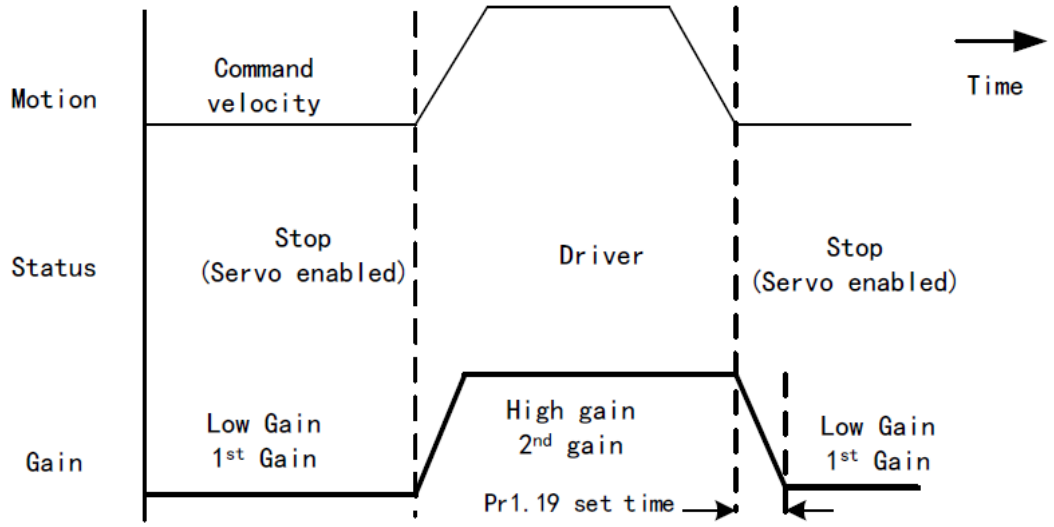
To set torque command low-Pass filter, add a filter delay time constant to torque command and filter out the high frequencies in the command.
Often used to reduce or eliminate some noise or vibration during motor operation, but it will reduce the responsiveness of current loop, resulting in undermining velocity loop and position loop control. PR1.04 needs to match velocity loop gain.
Recommended range: 1,000,000/(2π×PR1.04) ≥PR1.01×4
For example: Velocity loop gain PR1.01=180(0.1Hz) which is 18Hz. Time constant of torque filter should be PR1.01≤221(0.01ms)
If mechanical vibration is due to servo driver, adjusting PR1.04 might eliminate the vibration. The smaller the value, the better the responsiveness but also subjected to machine conditions. If the value is too large, it might lower the responsiveness of current loop.
With higher PR1.01 value settings and no resonance, reduce PR1.04 value;
With lower PR1.01 value settings, increase PR1.04 value to lower motor noise.

6.5 Gain switching

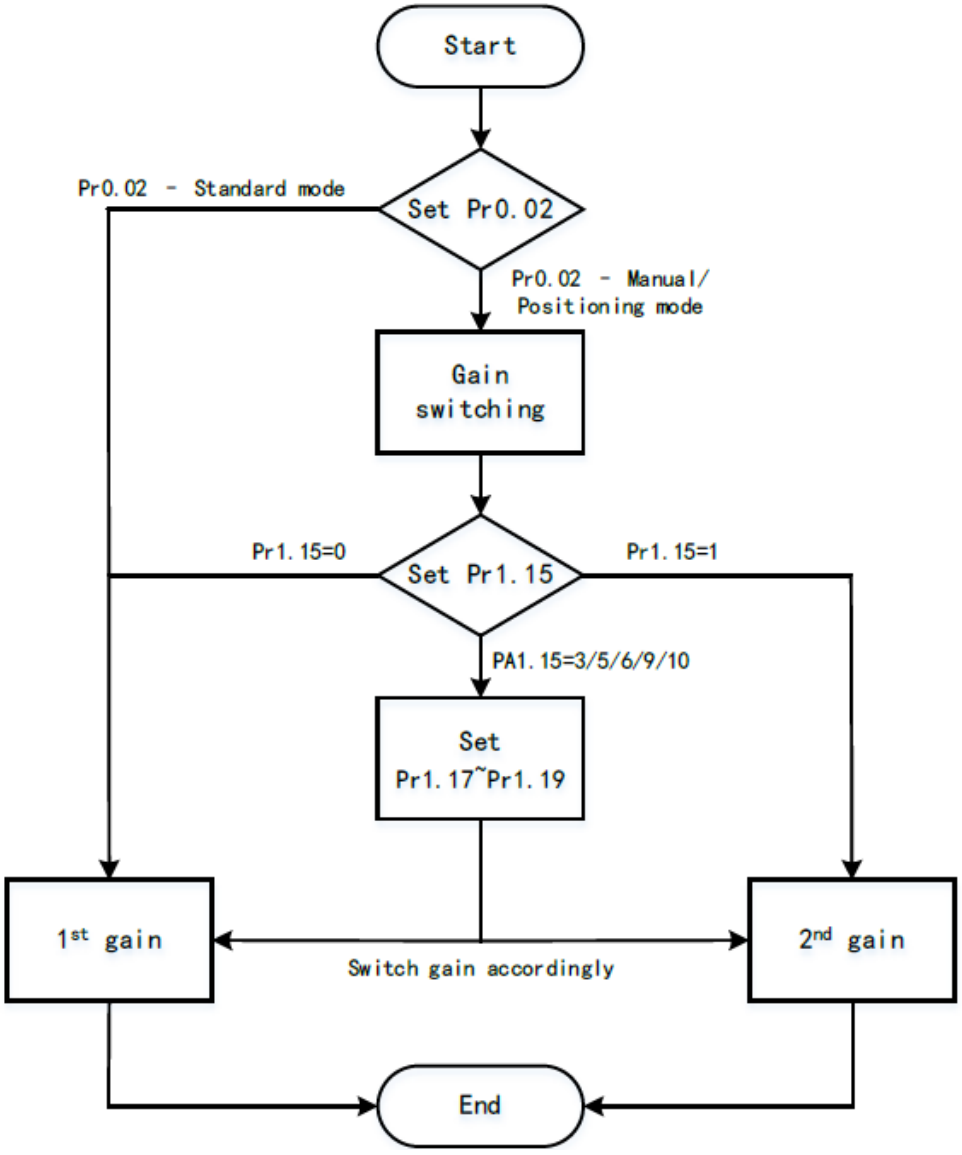
Gain switching function can be triggered internally in servo driver. Only valid under position or velocity control mode. Following effects can be realized by gain switching:

1. Switch to lower gain when motor stops to suppress vibration
2. Switch to higher gain when motor is moving at a low velocity to shorten positioning time
3. Switch to higher gain when motor is moving at a high velocity to improve command following behavior.

Diagram below shows gain switching when motor stops



1st gain (Pr1.00-Pr1.04) and 2nd gain (Pr1.05-Pr1.09) switching can be realized through manual and positioning mode. Switching condition is set through Pr1.15. Gain switching is invalid under standard mode.



Related Parameter on gain switching

No.	Parameter	Label	Remarks
1	PR1.15	Position control gain switching mode	In position control, set PR1.15=3,5,6,9,10。 In velocity control, set PR1.15=3,5,9
2	PR1.17	Position control level switching	Please set PR1.17≥PR1.18
3	PR1.18	Position control hysteresis switching	If PR1.17＜PR1.18, driver will set PR1.17＝PR1.18
4	PR1.19	Position gain time switching	

PR1.15						
	Label	Position control gain switching mode	**Mode**	**F**		
	Range	0~11	**Default**	0	**Unit**	-
	Activation	Immediate			**Index**	2115h

Set Value	Condition	Gain switching condition
0	1st gain fixed	Fixed on using 1st gain(PR1.00-PR1.04)
1	2nd gain fixed	Fixed on using 2nd gain (PR1.05-PR1.09)
2	Reserved	
3	High set torque	Switch to 2nd gain when set torque command absolute value larger than (level + hysteresis)[%] Switch to 1st gain when set torque command absolute value smaller than (level + hysteresis)[%] 4	Reserved	Reserved
5	High set velocity	Valid for position and velocity control. Switch to 2nd gain when set velocity command absolute value larger than (level + hysteresis)[r/min]  Switch to 1st gain when set velocity command absolute value smaller than (level-hysteresis) [r/min]

6	Large position deviation	Valid for position control. Switch to 2nd gain when position deviation absolute value larger than (level + hysteresis)[pulse] Switch to 1st gain when position deviation absolute value smaller than (level-hysteresis)[pulse] 7	Pending position command	Valid for position control. Switch to 2nd gain if position command ≠ 0 Switch to 1st gain if position command remains = 0 throughout the duration of delay time. 8	Not yet in position	Valid for position control. Switch to 2nd gain if position command is not completed. Switch to 1st gain if position command remains uncompleted throughout the duration of delay time. 9	High actual velocity	Valid for position control.  Switch to 2nd gain when actual velocity absolute value larger than (level + hysteresis)[r/min] Switch to 1st gain when actual velocity absolute value remains smaller throughout the duration of delay time than (level-hysteresis)[r/min]

10	Pending position command +actual velocity	Valid for position control. Switch to 2nd gain if position command ≠ 0 Switch to 1st gain if positional command = 0 throughout the duration of delay time and absolute value of actual velocity remains smaller than (level - hysteresis) (r/min) 
For position control mode, set PR1.15=3,5,6,9,10; For velocity control mode, set PR1.15=3,5,9;

*** Above 'level' and 'hysteresis' are in correspondence to PR1.17 Position control gain switching level and PR1.18 Hysteresis at position control switching.*

6.6 Feedforward gain

In position control, velocity feedforward is calculated by comparing the velocity control command calculated internally and velocity command calculated from position feedback. Comporting to control only using feedbacks, this will reduce position deviation and increase responsiveness. Besides, by comparing the torque needed during motion from velocity control command in comparison with velocity feedback, torque feedback can be calculated to improve system responsiveness.

6.6.1 Velocity feedforward

Velocity feedforward can be used in position control mode. When the function is enabled, it can increase velocity responsiveness, reduce position deviation during constant velocity.

PR1.10	**Label**	Velocity feed forward gain	**Mode**	**PP**	**HM**	**CSP**
	Range	0~1000	**Default**	300	**Unit**	0.10%
	Activation	Immediate			**Index**	2110h
Used for decreasing following error caused by low responsiveness of velocity loop. Might cause overshoot or increase in noise if set value is too high.						

PR1.11	**Label**	Velocity feed forward filter time constant	**Mode**	**PP**	**HM**	**CSP**
	Range	0~6400	**Default**	50	**Unit**	0.01ms
	Activation	Immediate			**Index**	2111h

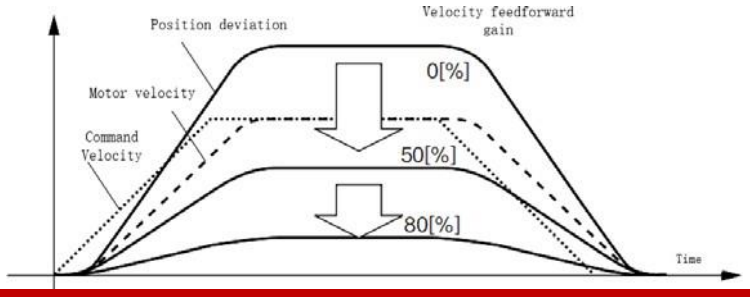
Set velocity feed forward low Pass filter to eliminate high or abnormal frequencies in velocity feed forward command. Often used when position command with low resolution or high electronic gear ration to smoothen velocity feed forward.

Position deviation under constant velocity can be lowered with higher velocity feed forward gain. Please to refer to the equation below.

$$\text{Position deviation[Unit]} = \frac{Set\ velocity[\frac{Uint}{s}]}{Position\ loop\ gain[Hz]} \times \frac{100 - Velocity\ feed\ foward\ gain[\%]}{100}$$

6.6.2 Velocity feedforward application

Set Pr1.11 to around 50 (0.5ms), then tune Pr1.10 from 0 to bigger values until the velocity feedforward achieves better performance. Under constant velocity, the position deviation in a motion will decrease as the velocity feedforward gain increase.



Steps to tuning:

1. Increase Pr1.10 to increase responsiveness but velocity overshoot might occur during acc-/deceleration.
2. By reducing Pr1.11, velocity feedforward would be more effective and vice versa. Pr1.10 and Pr1.11 need to be tuned to a balance.
3. If mechanical noise exists under normal working conditions, please increase Pr1.11 or use position command filter (1 time delay/ FIR smoothing filter)

6.6.3 Torque feedforward

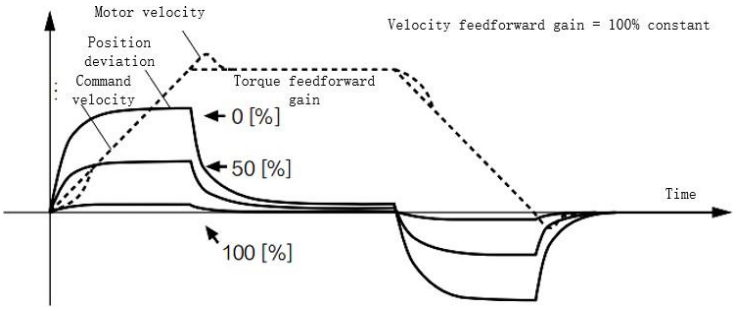
Position control mode:
Torque feedforward can increase the responsiveness of torque command, decrease position deviation during constant acc-/deceleration.
Velocity control mode:
Torque feedforward can increase the responsiveness of torque command, decrease velocity deviation during constant velocity.

PR1.12	Label	Torque feed forward gain	Mode	PP	PV	HM	CSP	CSV
	Range	0~1000	Default	0		Unit	0.1%	
	Activation	Immediate				Index	2112h	
Before using torque feed forward, please set correct inertia ratio PR0.04. By increasing torque feed forward gain, position deviation on constant acceleration/deceleration can be reduced to close to 0. Under ideal condition and trapezoidal speed profile, position deviation of the whole motion can be reduced to close to 0. In reality, perturbation torque will always exist, hence position deviation can never be 0.								

PR1.13	Label	Torque feed forward filter time constant	Mode	PP	PV	HM	CSP	CSV
	Range	0~6400	Default	0		Unit	0.01ms	
	Activation	Immediate				Index	2113h	
Low Pass filter to eliminate abnormal or high frequencies in torque feed forward command. Usually used when encoder has lower resolution or precision. Noise reduces if torque feed forward filter time constant is set higher but position deviation will increase at acceleration varied points.								

6.6.4 Torque feedforward application

Set Pr1.13 to around 50 (0.5ms), then tune Pr1.10 from 0 to bigger values until torque feedforward achieves better performance. Under constant acc-/deceleration, the position deviation in a motion will decrease as the velocity feedforward gain increase.

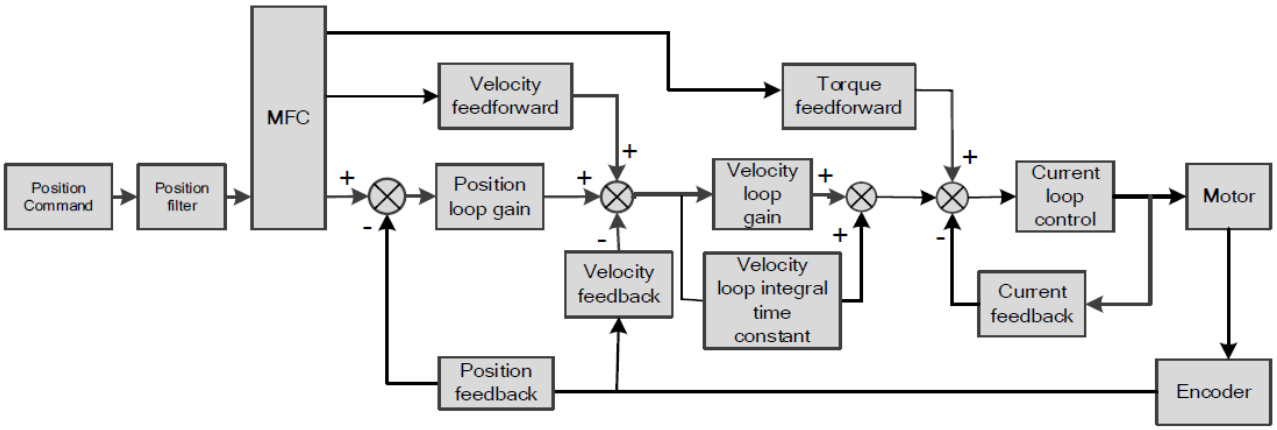


Steps to tuning:

2. Increase Pr1.12 to increase responsiveness but velocity overshoot might occur during acc-/deceleration.
3. By reducing Pr1.13, torque feedforward would be more effective and vice versa. Pr1.12 and Pr1.13 need to be tuned to a balance and reduce noise.

6.7 Model following control

Model following control is a type of closed loop control system. First, an ideal model is constructed and acts as a reference for actual model in a closed loop control. Model following control can be treated as a control mode with 2 flexibilities: Reference model can be used to improve command responsiveness and closed loop control used to increase responsiveness of the system towards interference. They don't affect each other.
Model following control can be used in position loop control to increase responsiveness to commands, reduce positioning time and following error. This function is only available in position control mode.



To adjust model following control

1. Automatic adjustment

Set model following bandwidth PR0.00 = 1 for automatic adjustment. Now, PR0.00 = PR1.01, model following bandwidth is adjusted automatically according to different velocity loop gain.

2. Manual adjustment

Please used manual adjustment if

- Automatic adjustment is not satisfactory.
- Responsiveness needs further improvement in comparison with automatic adjustment.
- There is a need to set servo gain or model following control Parameter s manually.

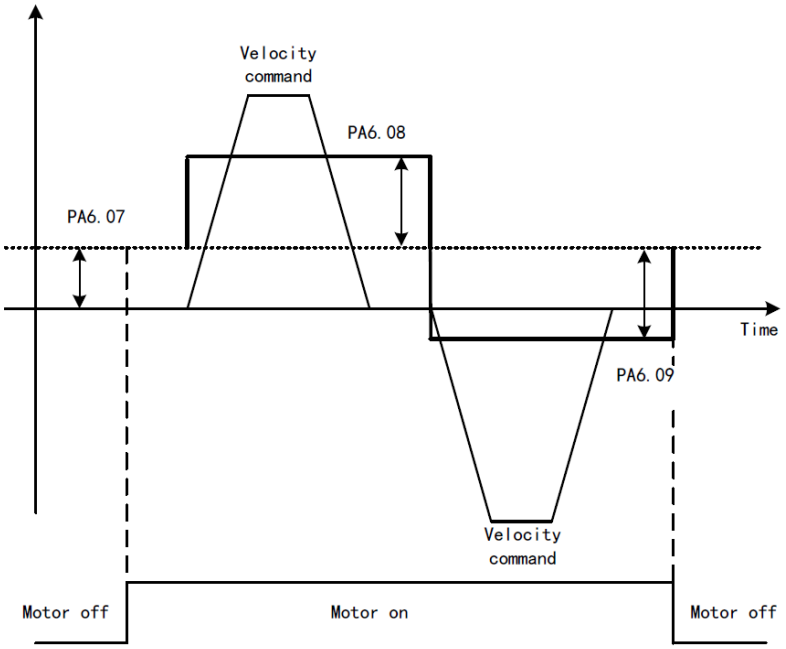
Steps to manually adjust

Step	Content
1	Set up vibration suppression.
2	Set up the right inertia ratio.
3	Manually adjust gain.
4	Increase PR0.00 provided that there is no overshoot and vibration. Usually, PR0.00 ≥ PR1.01 is recommended.

Model following bandwidth determines the responsiveness of the servo system. Increase the value set will increase responsiveness and reduce positioning time. Overshoot can be prevented if it is set at a lower value but responsiveness will be lowered. Model following bandwidth shouldn't be too large for mechanical structure with lower stiffness, excessive position deviation alarm might occur under high velocity.

6.8 Friction compensation function

This function is to compensation for changes in load to reduce the effect of friction in motion. The compensation value is directional.



Vertically loaded axis: A constant eccentric load torque is applied on the motor. By adjusting PR6.07, positioning deviation due to different motional direction can be reduced.
Belt-driven axis: Due to large radial load with dynamic frictional torque. Positioning time delay and deviation can be reduced by adjusting PR6.08 and PR6.09.

PR6.07	**Label**	Torque command additional value	**Mode**	**F**		
	Range	-100~100	**Default**	0	**Unit**	%
	Activation	Immediate			**Index**	2607h
To set torque forward feed additional value of vertical axis. Applicable for loaded vertical axis, compensate constant torque. Application: When load move along vertical axis, pick any point from the whole motion and stop the load at that particular point with motor enabled but not rotating. Record output torque value from d04, use that value as torque comman additional value (compensation value)						

PR6.08	**Label**	Positive direction torque compensation value	**Mode**	**F**		
	Range	-100~100	**Default**	0	**Unit**	%
	Activation	Immediate			**Index**	2608h
PR6.09	**Label**	Negative direction torque compensation value	**Mode**	**F**		
	Range	-100~100	**Default**	0	**Unit**	%
	Activation	Immediate			**Index**	2609h
To reduce the effect of mechanical friction in the movement(s) of the axis. Compensation values can be set according to needs for both rotational directions. Applications: When motor is at constant speed, d04 will deliver torque values. Torque value in positive direction = T1; Torque value in negative direction = T2 PR6.08/PR6.09 = Tf =|T1-T2|/2						

6.9 Parameter s adjustment under different control modes

Under different control mode, Parameter s adjustment has to be adjusted in this order: “Inertia measuring” -> “Auto gain adjustment”->” Manual gain adjustments”

6.9.1 Position control mode

Set load-inertia ratio PR0.04 after inertia determination.

No.	Parameter	Label
1	PR1.00	1st position loop gain
2	PR1.01	1st velocity loop gain
3	PR1.02	1st velocity integral time constant
4	PR1.03	1st velocity detection filter
5	PR1.04	1st torque filter time constant
6	PR1.05	2nd position loop gain
7	PR1.06	2nd velocity loop gain
8	PR1.07	2nd velocity integral time constant
9	PR1.08	2nd velocity detection filter
10	PR1.09	2nd torque filter time constant

11	PR1.10	Velocity feedforward gain constant
12	PR1.11	Velocity feedforward filter time constant
13	PR1.12	Torque feedforward gain
14	PR1.13	Torque feedforward filter time constant
15	PR1.15	Position control gain switching mode
16	PR1.17	Position control switching level
17	PR1.18	Position control switching hysteresis
18	PR1.19	Position gain switching time

1st and 2nd gain initial values are obtained by automatic gain adjustment

No.	Parameter	Label
1	PR1.00	1st position loop gain
2	PR1.01	1st velocity loop gain
3	PR1.02	1st velocity integral time constant
4	PR1.03	1st velocity detection filter
5	PR1.04	1st torque filter time constant
6	PR1.05	2nd position loop gain
7	PR1.06	2nd velocity loop gain
8	PR1.07	2nd velocity integral time constant
9	PR1.08	2nd velocity detection filter
10	PR1.09	2nd torque filter time constant

Manually adjusted gain Parameter s

No.	Parameter	Label
1	PR1.00	1st position loop gain
2	PR1.01	1st velocity loop gain
3	PR1.02	1st velocity integral time constant
4	PR1.04	1st torque filter time constant
5	PR1.10	Velocity feedforward gain constant
6	PR1.11	Velocity feedforward filter time constant

6.9.2 Velocity control mode

Velocity control mode Parameter s adjustment is pretty similar to position control mode. Except for position loop gain PR1.00 and PR1.05, velocity feedforward gain (Pr1.10)

6.9.3 Torque control mode

Parameter s adjustment for torque control mode has to be differentiate into 2 conditions:

1. When actual velocity reaches velocity limit, adjustment will be as per velocity control mode. Motor will switch from torque control to velocity limit as velocity control.
2. When actual velocity doesn't reach velocity limit yet, Except for position loop gain, velocity loop gain and feedforward gain, Parameter adjustments as per velocity control mode.

If there is no velocity limit and control is through torque command, please deactivate torque and notch filter,

set velocity limit to max. value and increase velocity loop gain to as high as possible.

6.10 Safety Functions

External brake deactivation output signal BRK-OFF

Please refer to PR4.11 to set up the I/O output function Parameter s. When enabled and timing conditions are fulfilled, the set I/O output will deliver ON signal.

PR4.37	**Label**	Motor power-off delay time	**Mode**	**F**		
	Range	0~3000	**Default**	100	**Unit**	1ms
	Activation	Immediate			**Index**	2437h
To set delay time for holding brake to be activated after motor power off to prevent axis from sliding.						

PR4.38	**Label**	Delay time for holding brake release	**Mode**	**F**		
	Range	0~3000	**Default**	0	**Unit**	1ms
	Activation	Immediate			**Index**	2438h

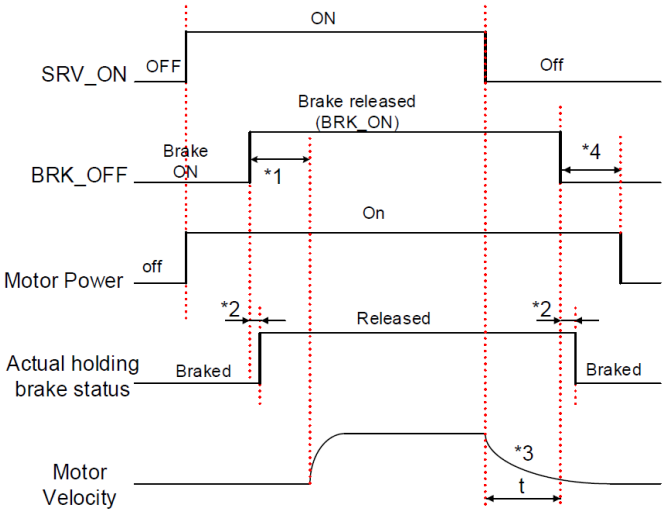
To set delay time for holding brake to be released after motor power on. Motor will remain at current position and input command is masked to allow holding brake to be fully released before motor is set in motion.

*1: Delay time set in PR4.38

*2: Delay time from the moment BRK_OFF signal is given until actual holding brake is released or BRK_ON signal is given until actual holding brake is activated. It is dependent on the holding brake of the motor.

*3: Deceleration time is determined by PR6.14 or if motor speed goes below PR4.39, whichever comes first. BRK_OFF given after deceleration time.

*4: PR4.37 set time value.



Delay time from the moment SRV_ON is given until BRK_OFF switch to BRK_ON, is less than 500ms.

6.10.1 Emergency stop function

Emergency stop is used when an alarm occurs or a servo prohibition signal is received when servo driver is enabled.

Method 1: Set up PR4.43 to enable the function

PR4.43	Label	Emergency stop function	Mode	F		
	Range	0~1	Default	0	Unit	-
	Activation	Immediate			Index	2443h
0：Emergency stop is valid, servo driver will be forced to STOP and alarm occurs. 1：Emergency stop is invalid; servo driver will not be forced to STOP.						

PR5.04	Label	Driver prohibition input settings	Mode	F		
	Range	0~2	Default	0	Unit	-
	Activation	Immediate			Index	2504h

To set driver prohibition input (POT/NOT): If set to 1, no effect on homing mode.

Set value	Description
0	POT → Positive direction drive prohibited NOT → Negative direction drive prohibited
1	POT and NOT invalid
2	Any single sided input from POT or NOT might cause Er260

In homing mode, POT/NOT invalid, please set object dictionary 5012-04 bit0=1

Method 2: Using 605Ah object dictionary through master device to activate this function

PR5.11	Label	Servo braking torque setting	Mode	F		
	Range	0~500	Default	0	Unit	%
	Activation	Immediate			Index	2511h

To set torque limit for servo braking mode.

If PR5.11 = 0, use torque limit as under normal situation.

Between max. torque 6072 and PR5.11, actual torque limit will take smaller value.

6.11 Vibration Suppression

6.11.1 Mechanical resonance suppression

Mechanical system has certain resonance frequencies. When servo gain is increased, resonance might occur at around mechanical resonant frequencies, preventing gain value from increasing. In such situation, notch filter can be used to suppress resonance to set higher gains or lower vibration.

To suppress mechanical resonance:

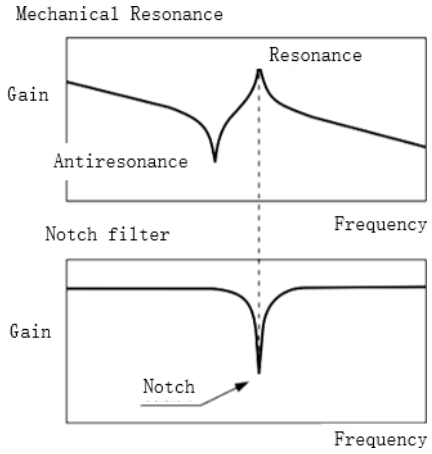
1. Torque command filter time constant

Set filter time constant to reduce gain at around resonant frequencies

Torque command filter blocked frequencies(Hz) fc=1/ [2π×PR1.04(0.01ms)×0.00001）]

2. Notch filter

Notch filter suppresses mechanical resonance by reducing gain at certain frequencies. When notch filter is correctly set, resonance can be suppressed and servo gain can be increased.



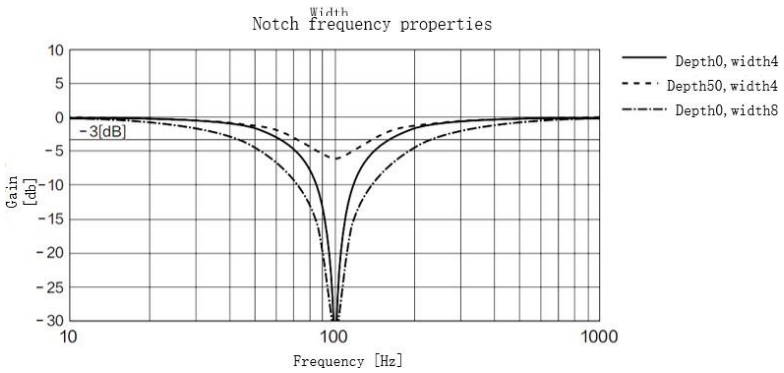
- Notch filter bandwidth

Center frequency of the notch filter, frequency bandwidth with reduction of -3dB.

- Notch filter depth

The ratio between input and output of center frequency.

When depth = 0, center frequency output is totally off and when depth = 100, Hence when notch filter depth is set at lower value, the depth is higher and better at suppressing mechanical resonance but it might cause system instability.



If the amplitude-frequency curve from mechanical properties analysis tool doesn't show any obvious peak but vibration did occur, it might not be due to mechanical resonance, it may be that servo gain has reached its limit. This kind of vibration can't be suppressed by using notch filter, only by reducing gain and torque command filter time.

To use notch filter

Automatic notch filter

1. Set PR2.00 = 1 for auto notch filter adjustment
2. If PR0.03 stiffness increases, 3rd group of notch filter (PR2.07/PR2.08/PR2.09) updates automatically when driver is enabled. PR2.00 = 0, auto adjustments stop.

If resonance is suppressed, it means self-adjusting notch filter is working. If resonance occurs when mechanical stiffness increases, please use manual notch filter, set filter frequency to actual resonant frequency.

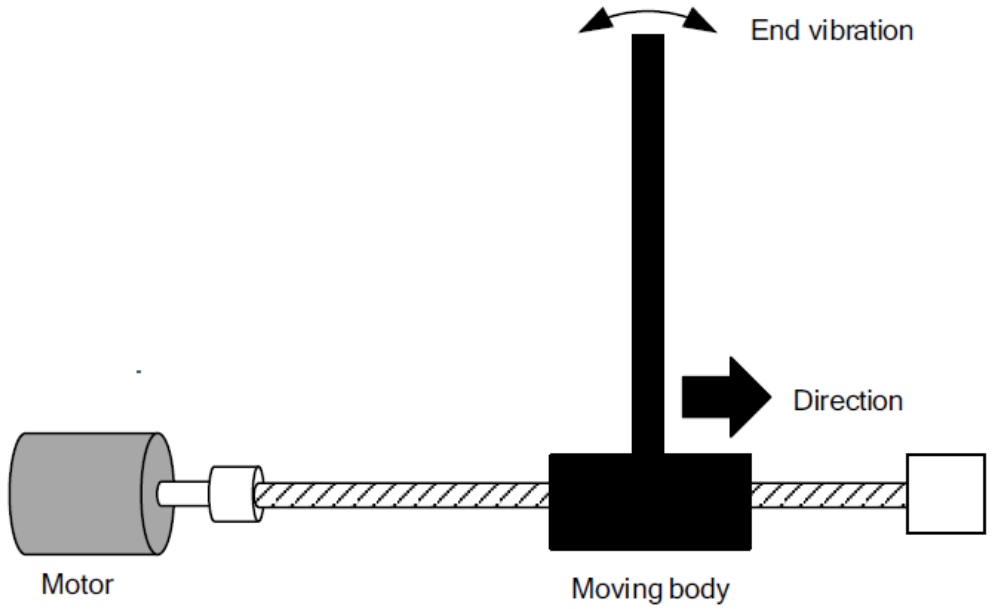
Manual notch filter

There are 2 ways to use manual notch filter.

1. After enabling self-adjusting notch filter, set the values from 3rd group of filters to 1st group of notch filter (PR2.01/PR2.02/PR2.03), see if resonance is suppressed. If there is other resonance, set PR2.00 = 1, then set the values from 3rd group of filters to 2nd group of notch filter (PR2.04/PR2.05/PR2.06)

2. Get resonant frequency, notch filter bandwidth and depth and set it into the corresponding Parameter s through Optimus tuning software.

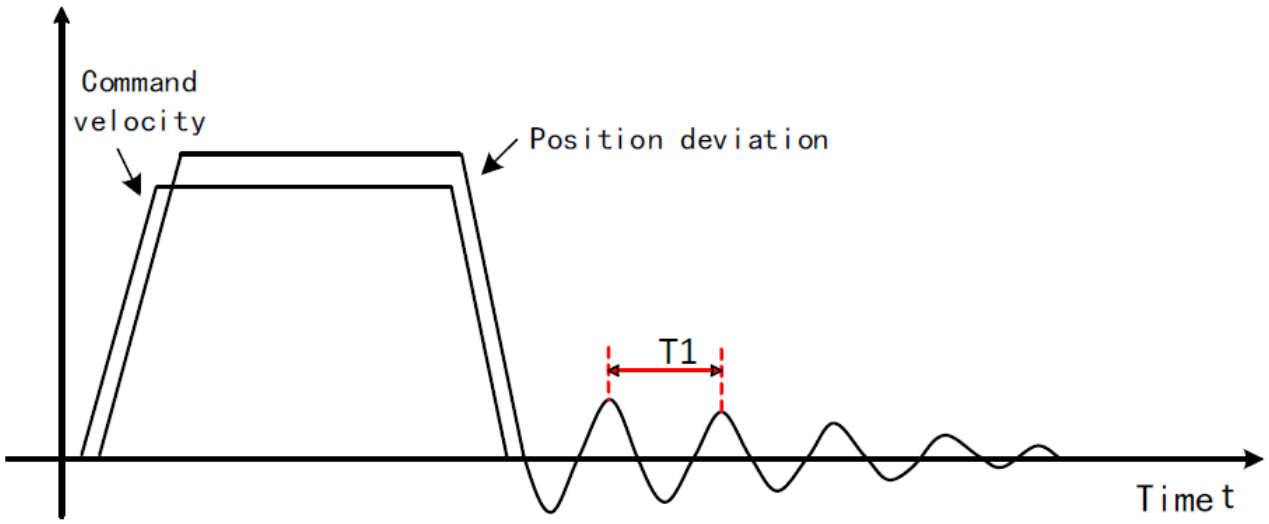
6.11.2 End vibration suppression



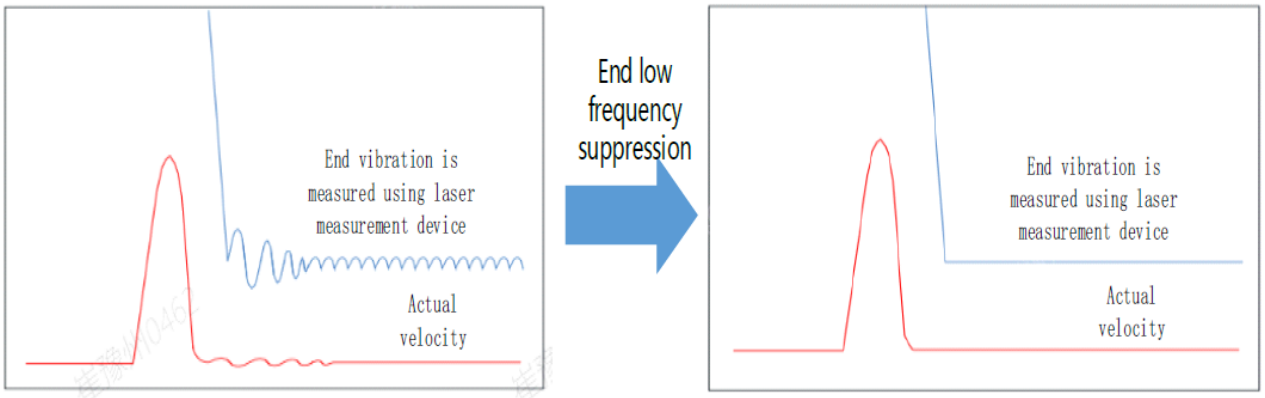
If the mechanical structure has an end that is long and heavy, it might cause end vibration at emergency stop and affect the positioning. Usually happens on long armed axis with loose end. The frequency is usually within 100Hz which is lower than mechanical resonant frequencies. It is called low-frequency resonance which can be prevented by applying low frequency suppression function.

To apply low frequency suppression

1. Trace current/ position deviation waveform when motion stops.
2. Measure the vibration cycle T1 of current waveform.
3. Convert T1 into low frequency resonance by F1 = 1/T1
4. Write F1 into PR2.14
5. If some other low frequency resonance occurs, please repeat step 1-3 and write F2 into PR2.16.

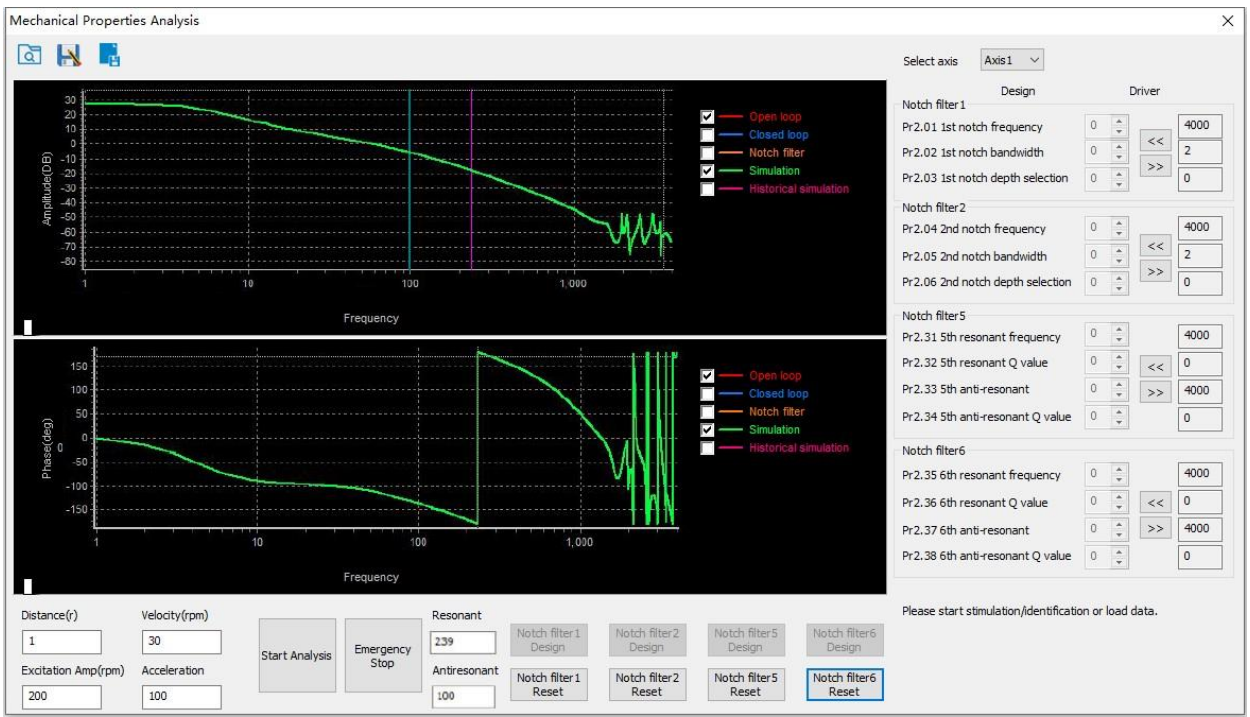


The result of suppressing low frequency resonance



6.11.3 Mechanical properties analysis

To determine mechanical and set up notch filter Parameter s to suppress vibration caused by resonance.



To avoid strong vibration, please first set lower excitation amplitude. However, if the set value is too low, data waveform will include some degree of distortion.
If vibration occurs during tests which can't be reduce through lowering electrical current excitation, it might be due to excessive gain. Please lower velocity gain and set notch filter as accordance from the mechanical properties analysis. Or might be due to inertia settings (Pr0.04) is too large, please use optimal inertia ratio value.

6.12 Multiturn absolute encoder

Multiturn absolute encoder records the position and the revolution counts of the motor. When driver is powered-off, multiturn absolute encoder will backed up the data using battery and after powering on, the data will be used to calculated absolute mechanical position and there is no need for a mechanical homing process. Use widely in robotic arms and CNC machines.
If it is the first time using the encoder, please home the mechanical axis and initialize the absolute position of the encoder to zero. Set up a homing point and only home when there is an alarm. Please stop the axis before reading any position data to prevent inaccuracy.

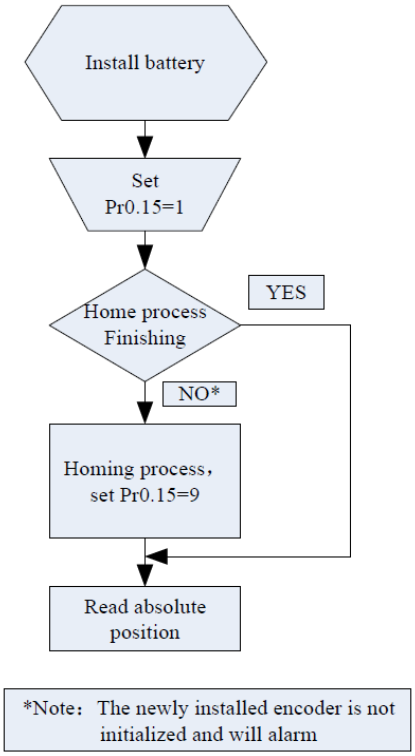
6.12.1 Parameters setting

PR0.15	**Label**	Absolute Encoder settings	**Mode**	**PP**	**HM**	**CSP**
	Range	0~32767	**Default**	0	**Unit**	-
	Activation	Immediate			**Index**	2015h

0: Incremental mode:
Used as an incremental encoder. Doesn't retain position data on power off. Unlimited travel distance.
1: Multiturn linear mode:
Used as a multiturn absolute encoder. Retrain position data on power off. For applications with fixed travel distance and no multiturn data overflow.
2: Multiturn rotary mode:
Used as a multiturn absolute encoder. Retrain position data on power off. Actual data feedback in between 0-(PR6.63). Unlimited travel distance.
3: Single turn absolute mode:
Used when travel distance is within 1 revolution of the encoder. Data overflow will trigger alarm.
5: Clear multiturn alarm and activate multiturn absolute function. Will switch to multiturn mode once alarm cleared, if remains at 5 after 3s, please solve according to Er153.
9: Clear multiturn position, reset multiturn alarm and activate multiturn absolute function. Will switch to multiturn mode once alarm cleared, if remains at 9 after 3s, please solve according to Er153. ***Please disable axis before setting to 9 and home the axis before using.***

6.12.2 Read absolute position

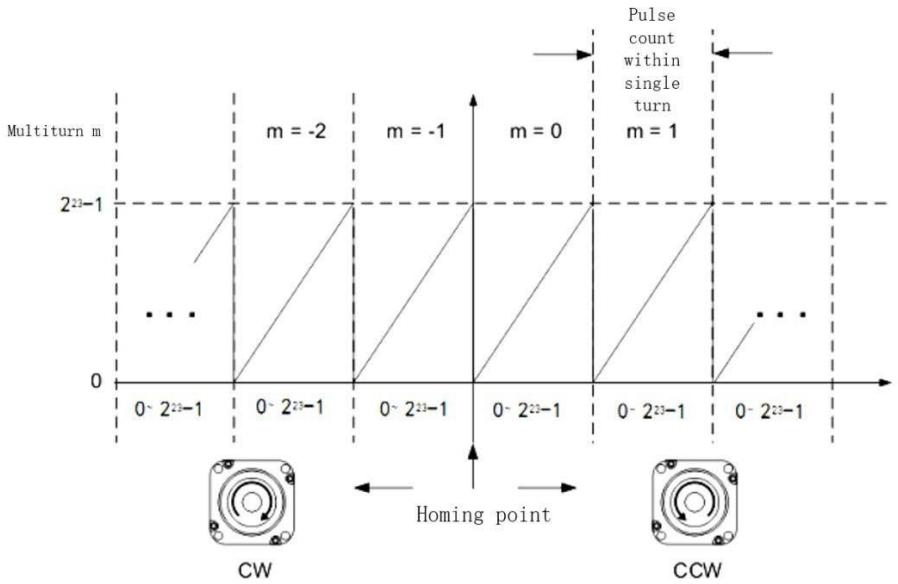
1、Steps：
1) First, select a motor with multiturn absolute encoder, install battery and confirm whether the driver version supports the specific motor;
2) Set PR0.15 = 1. If it is the first time of installation, Err153 will occur because battery is newly installed and position data is invalid. Please home the axis and initialize the absolute position of the encoder to zero.
3) When absolute homing point is set and there is no fault with the battery, the alarm will be cleared
4) Finally, the user can read the absolute position. Position won't be lost even if the driver is powered off.



2、Read absolute position

When the rotor turns in clockwise direction, the revolution count will be negative; turns in counter clockwise direction, the count will be positive. No. of revolutions will be from -32767 to +32767. If the count number reaches +32767 in counter clockwise direction, the count will revert back to -32768, -32767 and vice versa for clockwise direction.

As for position data, it depends on the precision of the encoder. For 17 bit = 0-131071, 23 bit = 0-8388607



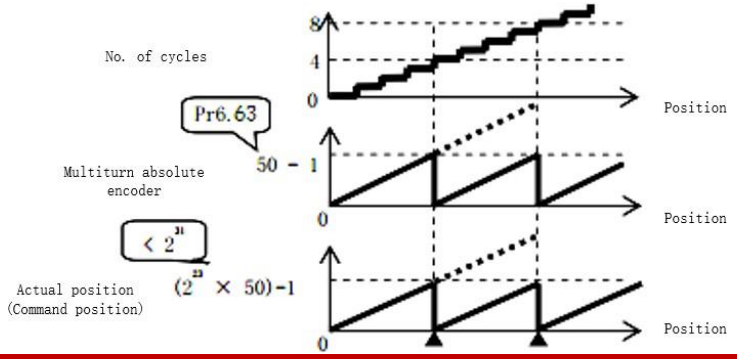
Read data from 6064h object dictionary

Please read data only when the motor is fully stopped or it might cause calculation errors.

Please repeat this step for at least twice to make sure the result is uniform.

Multiturn rotational mode

For absolute encoder, multiturn rotational mode (PR0.15 = 2, PR6.63 set to multiturn upper limit) is added on top of incremental mode and multiturn linear mode. Actual feedback multiturn data is always between 0 – [PR6.63 + 1], regardless of the direction of rotation. There is no limit to no. of rotation and no data overflow.



Single turn absolute mode

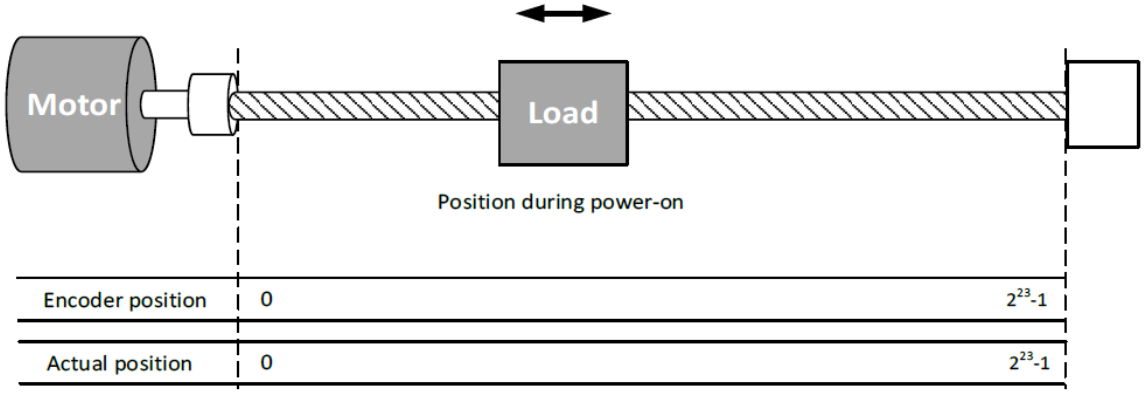
Use this mode when the travel distance of the axis is within a single turn of the rotor.

1. Target position input range – EtherCAT

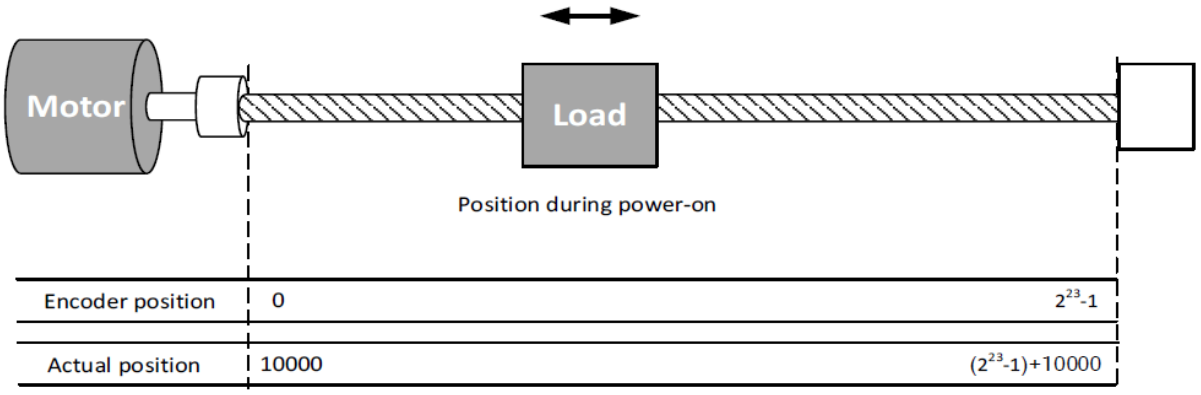
When using 23-bit absolute encoder, under single turn absolute mode, electronic gear ratio =1:1

Homing point offset 607Ch = 0, target position range = 0 – [2^{23}-1] Axis is homed, target position range = 607Ch – [2^{23}-1+607Ch]

When electronic gear ratio = 1:1, 607Ch = 0:



When electronic gear ratio = 1:1, 607Ch = 10000:



3、Clear multiturn position

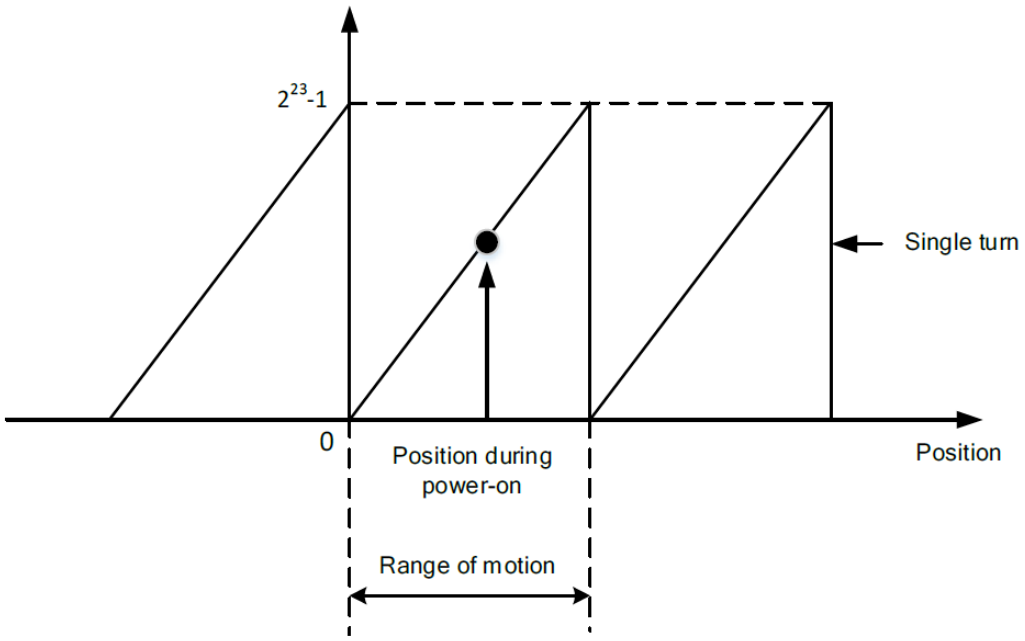
Before clearing multiturn position, axis needs to be homed. After clearing multiturn position, revolution count = 0 but absolute position remains unchanged and Err153 alarm will be cleared.

Please make sure the homing point is within the range of 1 revolution of the rotor. Installation and setup of the homing point can be set with the use of auxiliary function D21 on the front Panel.

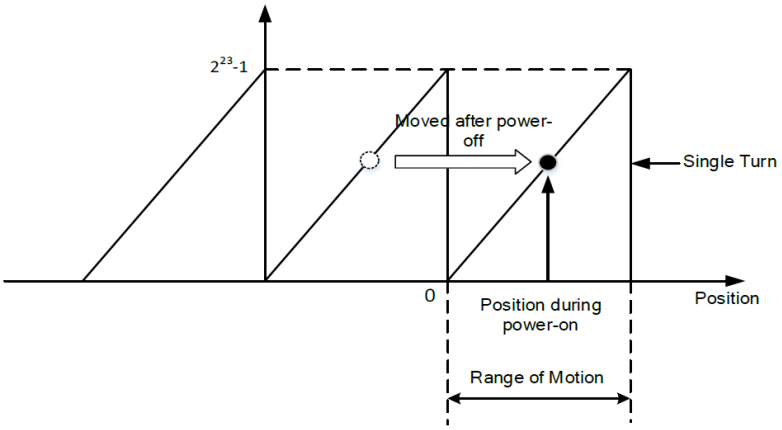
By setting PR0.15 to 9, multiturn position will be cleared.

Please take notice of motor position during power on. Range of motion of a motor depends on the position of the motor during power on (23-bit absolute encoder as example).

If the motor position is as shown below during power on. The range of motion of the motor is within the range of a single turn of the motor from motor position during power on.



If power is turned off at position as shown below and power on when motor reaches the position below. Motor range of motion changes as shown below.



6.12.3 Absolute Encoder Related Alarm

The alarm can determine if absolute value encoder is valid. If battery power is low, not a motor with absolute encoder, encoder error etc. occurs, user can find out about the error from alarm output or on the front Panel. Controller will stop any operation until alarm is cleared.

Alarm output:

Err153 will be shown on front Panel or by I/O ALM signal and from controller.

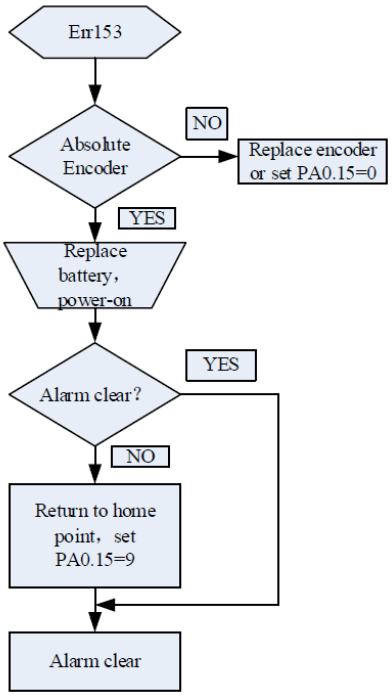
Err153 might occur,

（1） If absolute encoder is used for the first time and due to installation of new batteries Axis needs to be homed and multiturn data needs to be cleared.

（2） If battery voltage is lower than 3.2v. Replace battery and restart the motor.

（3） If battery voltage is lower than 2.5v or battery power was cut off. Replacing the battery won't clear the alarm. Axis needs to be homed and multiturn data needs to be cleared.

4、Alarm processing flow chart



6.13 Probe

Motor feedback position latching function can be realized through input signal with probe function. OSD-H-*-E supports up to 2 inputs with probe function and can be used simultaneously, to record the position information corresponding to probe signal rising and falling edge. Probe 1 signal comes from CN1 terminal pin 1 and 5 differential signal. Probe 2 signal comes from CN1 terminal pin 2-6 differential signal.

PR0.07	**Label**	Probe signal polarity settings	**Mode**	**F**		
	Range	0 ~ 3	**Default**	3	**Unit**	—
	Activation	After restart			**Index**	2007h
Probe signal polarity settings take effect when PR0.01 = 9						
0	Probe 1 & 2 polarity inversion					

1	Probe 2 polarity inversion
2	Probe 1 polarity inversion
3	No polarity inversion for probe 1 & 2

If PR0.01 ≠ 9, PR0.07 = Command pulse input mode settings.

Command pulse input

Command Polarity inversion (PR0.06)	Command pulse input mode settings (PR0.07)	Command Pulse Mode	Positive signal	Negative signal
【0】	0 *or* 2	90°phase difference 2 phase pulse （Phase A+ Phase B）			1	CW pulse sequence ＋ CCW pulse sequence		
	【3】	Pulse sequence ＋ Directional symbol		
1	0 *or* 2	90°phase difference 2 phase pulse （Phase A＋Phase B）		
	1	CW pulse sequence ＋ CCW pulse sequence		
	□3	Pulse sequence ＋ Directional symbol		

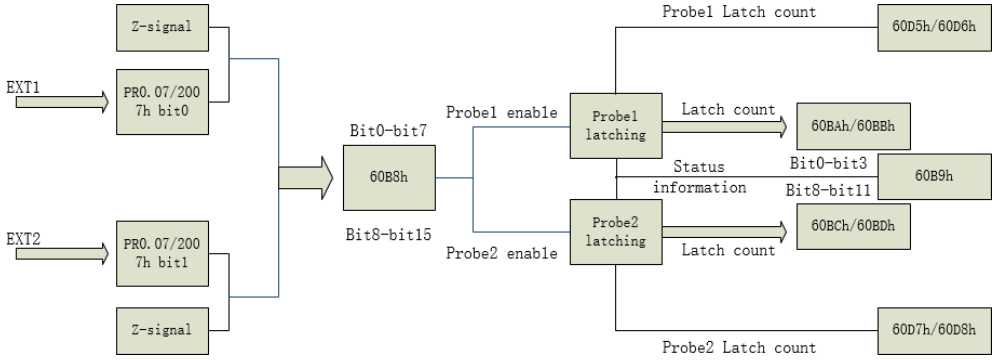
Command pulse input signal max. frequency and min. duration needed

Command pulse input interface		Max. Frequency	Min. duration needed (μs)					
			t1	t2	t3	t4	t5	t6
Pulse sequence interface	Differential	500 kHz	2	1	1	1	1	1
	Open collector	200 kHz	5	2.5	2.5	2.5	2.5	2.5

Please set >0.1μs for the duration between rising and falling edge of command pulse input signal.

1 revolution with 2500 pulses 2-phase pulse input when PR0.07=0 or 2, PR0.08 = 10000; 1 revolution with 10000 pulses 1 phase pulse input when PR0.07=1 or 3, PR0.08 = 10000

6.13.1 Probe function



When using EXT1 or EXT2 as probe, please set as following:

a) Set polarity of EXT 1 or EXT 2 as probe. Set the level polarity of the probes using 0x2007 / Pr0.07. Bit 0 for EXT1 signal, bit 1 for EXT2 signal

b) Probe function is set through 0x60B8 (Bit 0-7 is for probe 1, bit8-15 is for probe 2). Functions including activation trigger signal selection, triggering mode and triggering signal edge.

Please take note:

（i） Triggering mode: Single trigger, rising signal edge = valid; triggering mode: Continuous trigger, rising and falling edge = valid

（ii） After activation, trigger signal selection, triggering signal edge settings, counter will be reset and 0x60B9 status will change as well.

（iii） Probe signal level is shown in 60FD: EXT1 -> bit 26, EXT2 -> bit 27.

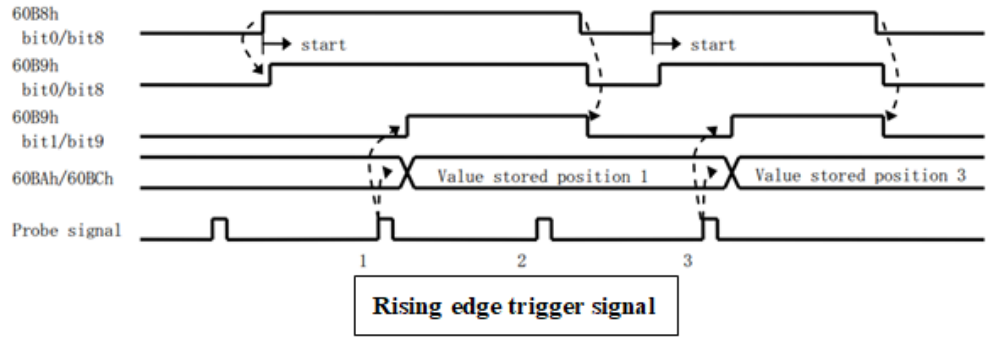
6.13.7 Probe mode

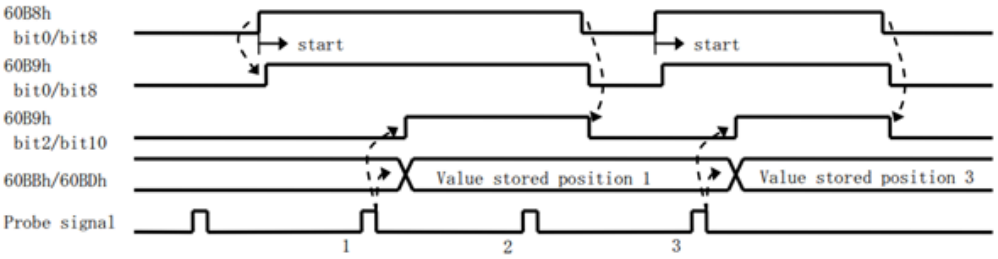
Set bit1/bit9 of 60B8h (Probe mode), 0 = Single trigger mode, 1 = Continuous trigger mode.

（1） Single trigger mode

Triggers only when the trigger signal is valid for the first time. In order to latch the position, users need to set bit0/bit8 of 60B8h to 0, then set bit0/bit8 of 60B8h to 1. The sequence diagram is as shown below:



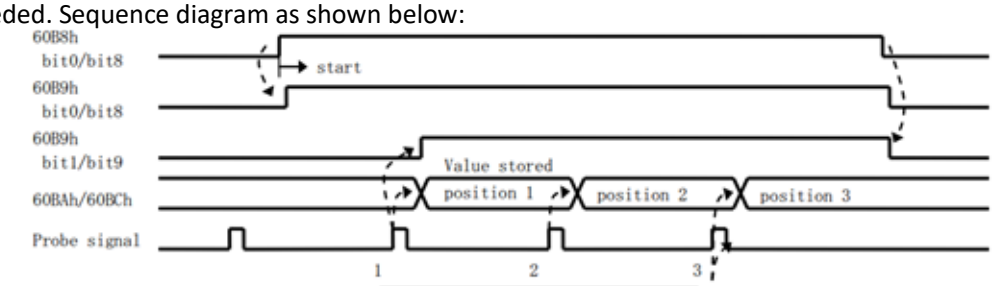
Rising edge trigger signal



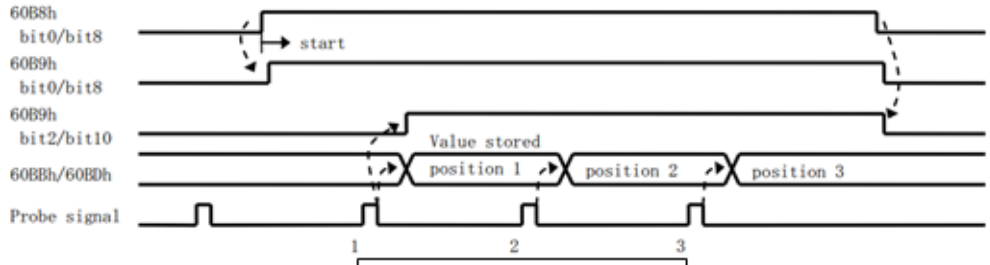
Falling edge trigger signal

(2) Continuous trigger mode

The data saved from signal triggering will be saved until the next trigger signal. Enabling the probe again is not needed. Sequence diagram as shown below:



Rising edge trigger signal



Falling edge trigger signal

6.14 Other Functions

6.14.1 Functions under Position mode

Electronic gear function

If command frequency from controller is not enough which cause the motor to not reach target rotational velocity, frequency can be increased using this function.

To set electronic gear ratio denominator								
Index 6092h-01	**Label**	Feed			**Mode**	**F**		
	Range	1~2147483647			**Default**	10000	**Unit**	*Command*/r
	Structure	VAR	**Type**	UINT32	**Mapping**	RPDO	**Access**	RW

If 6092h-01(Feed constant) is not equal to 608Fh(Position encoder resolution), then: Electronic gear ratio = Encoder increments / 6092h-01

If 6092h-01(Feed constant) is equal to 608Fh(Position encoder resolution), then: Electronic gear ratio = 6091-01 / 6092h-01

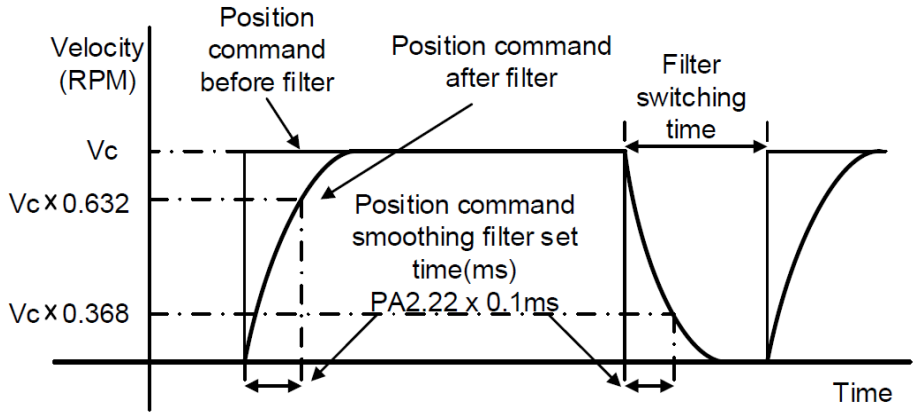
Position command filter function

To smoothen the position command after frequency divider/multiplier

PR2.22	**Label**	Position command smoothing filter	**Mode**	**PP**	**HM**	**CSP**
	Range	0~32767	**Default**	300	**Unit**	0.1ms
	Activation	After stopping			**Index**	2222h

To set time constant of 1 time delay filter of position command.

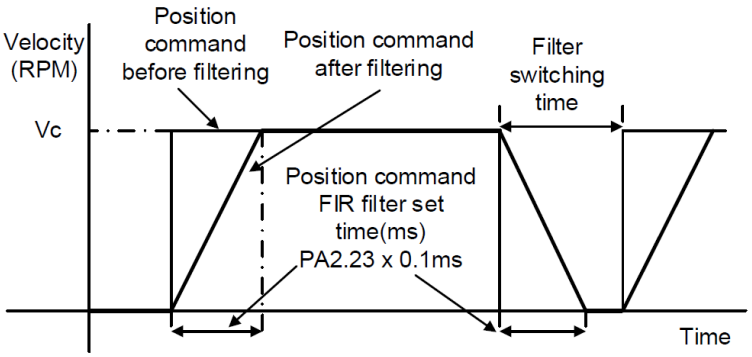
To set time constant of 1 time delay filter, according to target velocity Vc square wave command as show below.



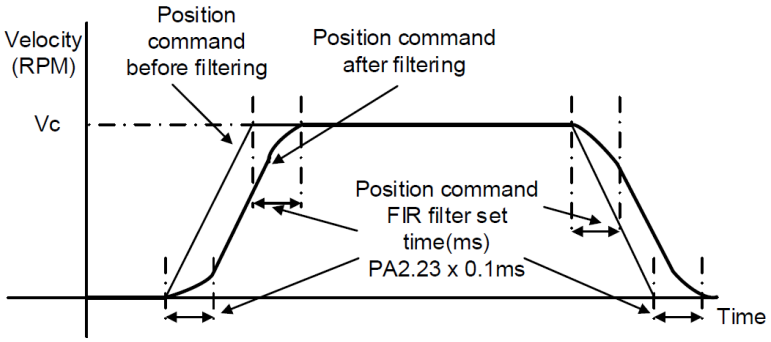
Usually applied when there is rather sharp acceleration which might cause motor overshoot or undershoot. To smoothen command signal, reduces impact to machines and eliminate vibration. If PR2.22 is set too high, overall time will be lengthened.

PR2.23	Label	Position command FIR filter	Mode	PP	HM	CSP
	Range	0~10000	Default	0	Unit	0.1ms
	Activation	After disabling			Index	2223h

As shown below, when target velocity Vc square wave command reaches Vc, it becomes trapezoidal wave after filtering.



As shown below, when target velocity Vc trapezoidal command reaches Vc, it becomes S wave after filtering.



Usually applied when there is rather sharp acceleration which might cause motor overshoot or undershoot. To smoothen command signal, reduces impact to machines and eliminate vibration. If PR2.23 is set too high, overall time will be lengthened.

***Please wait for command to stop and after filter idle time to modify PR2.23. Filter switching time = (PR2.23 set value x 0.1ms + 0.25ms)*

In Position

Positioning completed status can be determined by output of INP signal. Under position control mode, the absolute value of position deviation counter will be ON if positioning is under the range set in PR4.31.

PR4.31	Label	Positioning complete range	Mode	PP	HM	CSP
	Range	0~10000	Default	20	Unit	*Command*
	Activation	Immediate			Index	2431h
To set position deviation range of INP1 positioning completed output signal.						

PR4.32	Label	Positioning complete output settings	Mode	PP	HM	CSP
	Range	0~4	Default	1	Unit	-
	Activation	Immediate			Index	2432h

Output conditions of INP1 positioning completed output signal

Set value	Positioning completed signal
0	Signal valid when the position deviation is smaller than PR4.31
1	Signal valid when there is no position command and position deviation is smaller than PR4.31
2	Signal valid when there is no position command, zero-speed clamp detection (ZSP) signal is ON and the positional deviation is smaller than PR4.31
3	Signal valid when there is no position command and position deviation is smaller than PR4.31. Signal ON when within the time set in PR4.33 otherwise OFF.
4	When there is no command, position detection starts after the delay time set in PR4.33. Signal valid when there is no position command and positional deviation is smaller than PR4.31.

PR4.33	Label	INP positioning delay time	Mode	PP	HM	CSP
	Range	0~15000	Default	0	Unit	1ms
	Activation	Immediate			Index	2433h

To set delay time when PR 4.32 = 3

Set value	Positioning completed signal
0	Indefinite delay time, signal ON until next position command
1-15000	OFF within the time set; ON after time set. Switch OFF after receiving next position command.

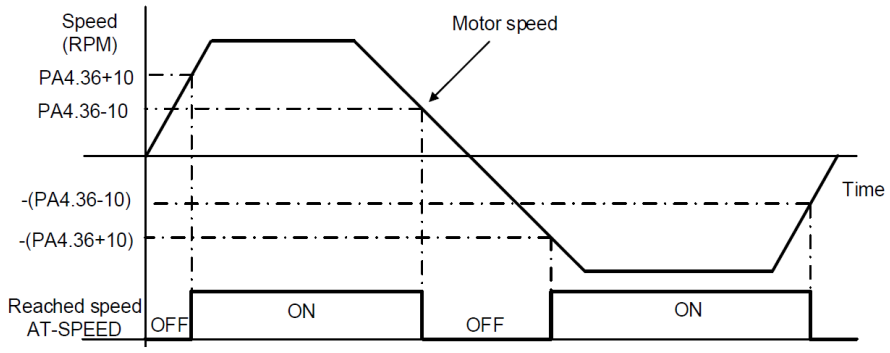
6.14.2 Functions under velocity mode

Velocity reached output signal (AT-SPEED)

AT-SPEED signal delivers after motor velocity reached target velocity.

PR4.36	Label	Reached speed (AT-speed)	Mode	PV		CSV
	Range	10~2000	Default	1000	Unit	RPM
	Activation	Immediate			Index	2436h

When motor velocity > PR4.36, AT-speed output signal is valid. Detection using 10RPM hysteresis



Velocity coincidence output

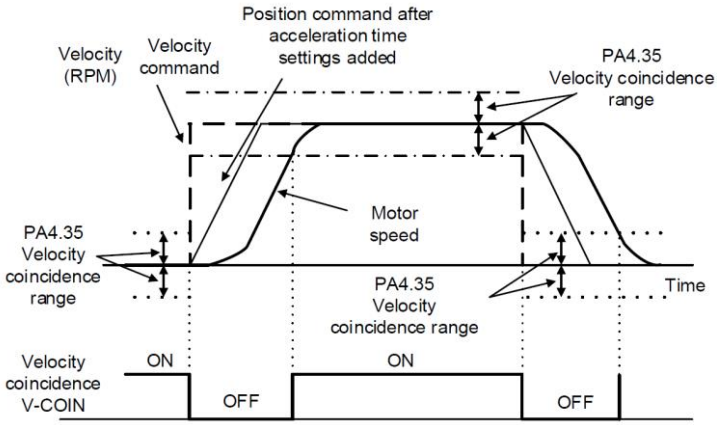
Velocity command (before acc-/deceleration) coincides with motor velocity. If the difference between velocity command and motor velocity is within the range set in PR4.35, it is treated as the velocity coincides.

PR4.35	**Label**	Velocity coincidence range	**Mode**	**PV**		**CSV**
	Range	10~2000	**Default**	50	**Unit**	RPM
	Activation	Immediate			**Index**	2435h

If the difference between velocity command and motor actual speed is below PR4.35, Velocity coincidence (V-COIN) output signal valid.

Due to 10RPM hysteresis:

Velocity coincidence output OFF -> ON timing (PR4.35 -10) r/min Velocity coincidence output ON -> OFF timing (PR4.35 +10) r/min



Zero speed position output

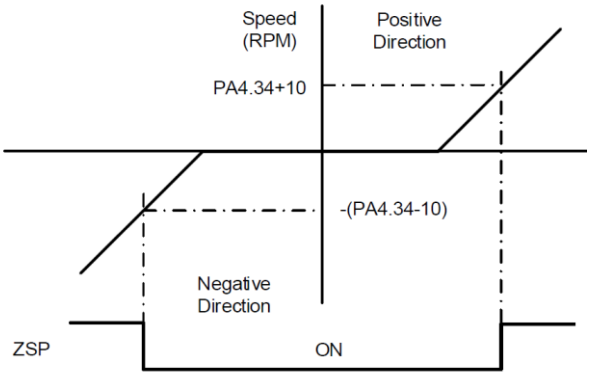
If the absolute value of the velocity feedback satisfies set conditions, corresponding output will be set to ON.

PR4.34	**Label**	Zero speed	**Mode**	**F**		
	Range	1~2000	**Default**	50	**Unit**	RPM
	Activation	Immediate			**Index**	2434h

To set threshold value for zero speed clamp detection.

Zero speed clamp detection (ZSP) output signal valid when motor speed goes under the value set in PR4.34

- Disregard the direction of rotation, valid for both directions.
- Hysteresis of 10RPM. Please refer to diagram on the right side.



6.14.3 Functions under torque mode

Velocity limit is required under torque mode to make sure motor rotational velocity stays within the limit.

Velocity limit function

During torque control, velocity control should be within the range of velocity limit. When motor reaches velocity limit, command control will switch from torque control to command control with velocity limit.

Due to gravitational or other external factors, torque command from controller might differ from the direction of rotation of the motor, velocity limit will be invalid. Please error occurs in such situation, please set PR5.13 as stopping velocity. If velocity is over the value set in PR5.13, Er1A0 might occur and motor will stop.

PR5.13	**Label**	Overspeed level setting	**Mode**	**F**		
	Range	0~10000	**Default**	0	**Unit**	RPM
	Activation	Immediate			**Index**	2513h
If motor speed exceeds PR5.13, Er1A0 might occur. When PR5.13 = 0, overspeed level = max. motor speed x 1.2						

Chapter 7 EtherCAT communication

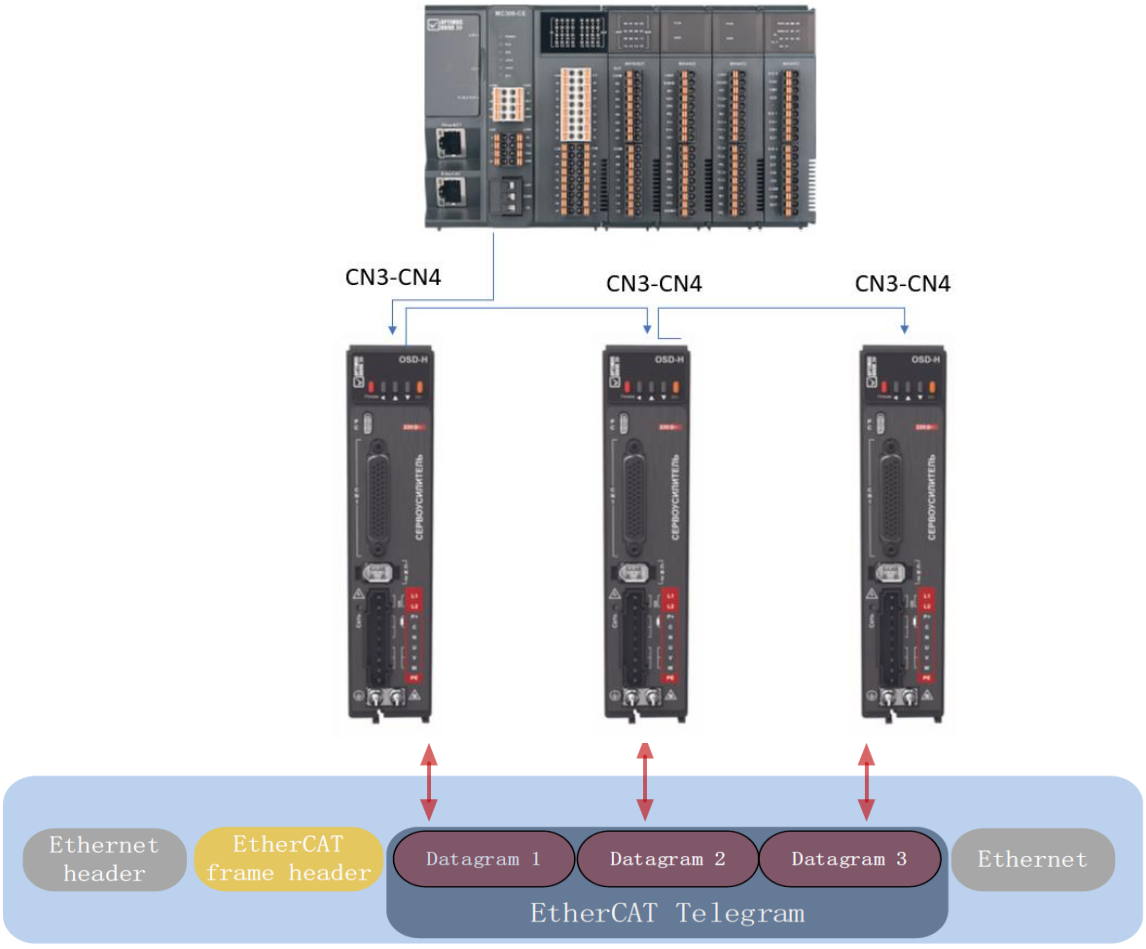
7.1 EtherCAT principle function

In comparison to Ethernet protocol which requires huge bandwidth for Packets to be moved between master and clients, EtherCAT communication protocol breaks through this systemic limitation of Ethernet which requires every client to receive the whole data Package from the master.

The EtherCAT master sends a telegram that Passes through each node. Each EtherCAT slave device reads the data addressed to it “on the fly”, and inserts its data in the frame as the frame is moving downstream. The frame is delayed only by hardware propagation delay times. The last node in a segment (or drop line) detects an open port and sends the message back to the master using Ethernet technology’s full duplex feature.

The telegram’s maximum effective data rate increases to over 90 %, and due to the utilization of the full duplex feature, the theoretical effective data rate is even higher than 100 Mbit/s (> 90 % of two times 100 Mbit/s).

The EtherCAT master is the only node within a segment allowed to actively send an EtherCAT frame; all other nodes merely forward frames downstream. This concept prevents unpredictable delays and guarantees real-time capabilities.



EtherCAT in standard Ethernet frame

ID number setting of EtherCAT slave station

To set up EtherCAT slave station ID number, please set PR0.24 = 1 and set required ID number to PR0.23.

PR0.23	Label	EtherCAT slave ID	Mode	F		
	Range	0~32767	Default	2	Unit	-
	Activation	After restart			Index	2023h
Set ID number of the slave station under EtherCAT mode						
PR0.24	Label	Source of slave ID	Mode	F		
	Range	0~1	Default	1	Unit	-
	Activation	After restart			Index	2024h
0: Master device automatically assigns a slave address. 1：The slave ID = PR0.23						

7.2 Synchronous Mode

7.2.1 Free Running Mode

In free moving mode, OSD-H-*-E processes the process data sent by the master asynchronously. It only applies to asynchronous motion mode such as homing mode, protocol position mode, etc.

Distributed clock synchronization mode

OSD-H-*-E adopts the synchronous mode of distributed clock as shown in figure 6.2. When the master station sends process data to the slave station, the slave station immediately reads the process data, and then waits for the synchronization signal to trigger the process data to act on the driver.

The process data must arrive at the OSD-H-*-E drive before the time of Sync0 signal T1. The drive has completed the analysis of the process data and relevant control calculation before the arrival of Sync0 event. After receiving Sync0 event, OSD-H-*-E immediately implements the control action which has a high synchronization performance.

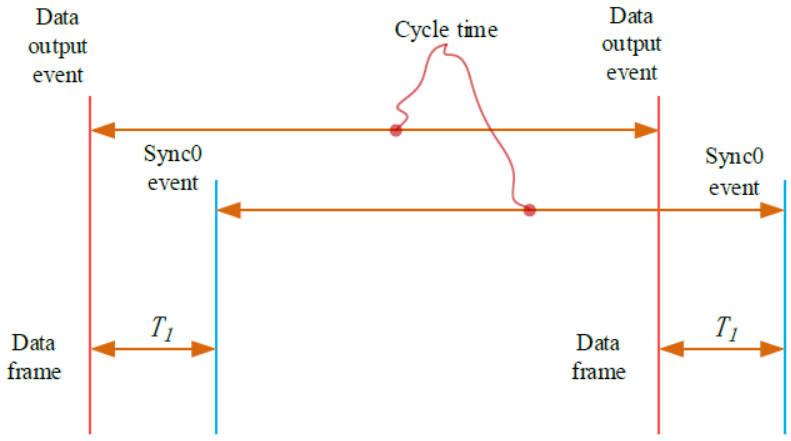


Figure 7.2 High performance synchronization mode

7.3 EtherCAT state machine

EtherCAT state machine, commonly known as "communication state machine ", is mainly used to manage communication between master and slave stations. The communication function mainly includes mailbox and process data communication. The EtherCAT state machine transition relationship is shown in figure 6.3

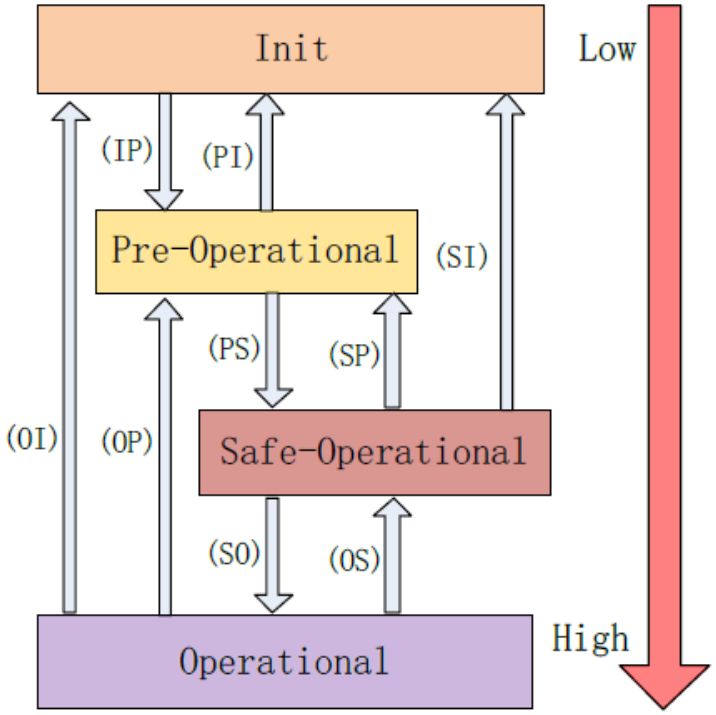

Figure 7.3 EtherCAT state machine transitions

EtherCAT state machine transitions have the following characteristics：

① from initialization to operational, the conversion must be carried out strictly in the order of initializing > pre-operational > safe operational > operational, from low to high, and no grade skipping is allowed

② When converting from high to low, grade skipping is allowed.

③ If state transition request to master station fails, slave station will send an error message to the master station.

EtherCAT 402 State Machine Communication function

State and transition	Communication function
Init	No mailbox or process data communication is possible.
Pre-Operational	Mailbox communication is effective, no process data communication, SDO function is valid
Safe-Operational	Mailbox communication and sending process data object is valid, SDO and TXPDO are valid
Operational	Mailbox communication, receive and send process data object valid, SDO, RXPDO and TXPDO valid

7.4 CANopen over EtherCAT (CoE)

7.4.1 Network structure of OSD-H-*-E

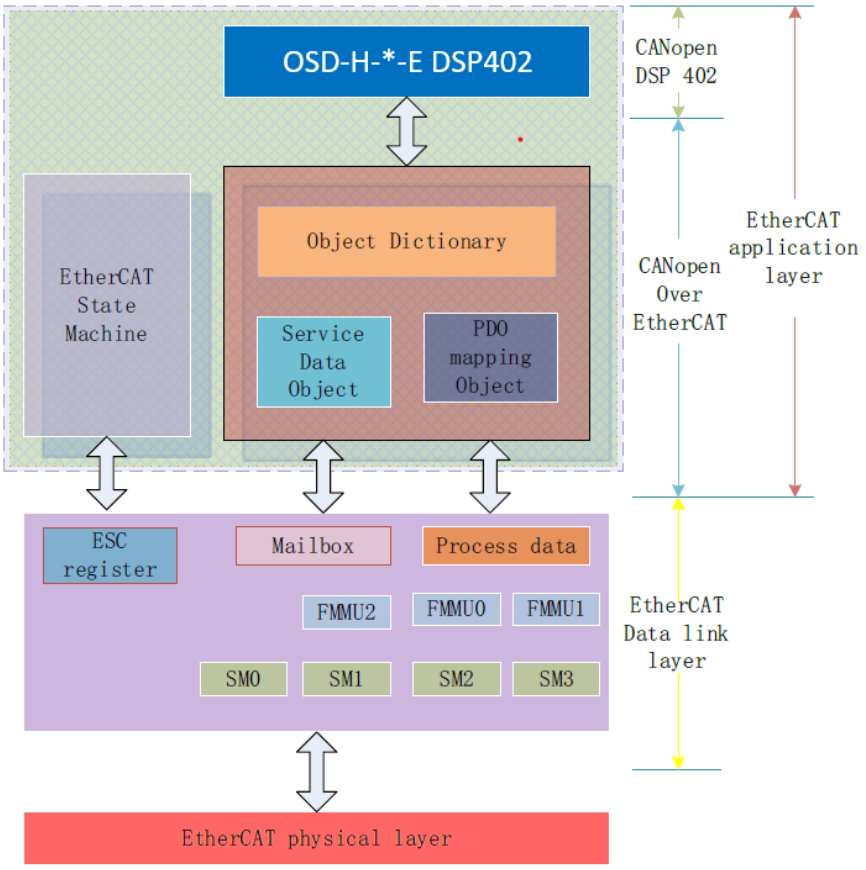

Figure 7.4 The structure of OSD-H-*-E network module

The data link layer is mainly implemented by EtherCAT slave station controller (ESC). OSD-H-*-E EtherCAT application layer protocol mainly includes application Part (CANopen DSP402), object dictionary and communication function (red frame Part), among which object dictionary and communication function can be jointly called CoE Part.

Object dictionary—Bridge of communication function and application Part. Communication function—Implementation of communication rules (SDO, PDO, etc.)

Application Part—Define the specific function of the device, such as the drive, IO module.

7.4.2 Object dictionary

EtherCAT master controls the OSD-H-*-E drive by writing and reading device state /information. To do this, the drive defines read-write Parameter s and read-only state values. Object dictionary is the collection of these Parameter s and states.

The OSD-H-*-E object dictionary contains all DSP402 and CoE related data objects in a standardized manner. It is a collection of OSD-H-*-E Parameter data structures.

The OSD-H-*-E object dictionary is the interface with which the controller communicates. EtherCAT master implements OSD-H-*-E motion control through the interface of object dictionary.

7.4.3 Service Data Object (SDO)

The OSD-H-*-E series supports SDO services. EtherCAT master can configure, monitor and control OSD-H-*-E servos by using SDO to read and write OSD-H-*-E object dictionaries.
In conventional CANopen DS301 mode, SDO protocol CAN only transfer 8 bytes at a time to match the data length of CAN message. In COE enhancement mode, only the Payload data is expanded without changing the protocol head; In this way, the SDO protocol uses mailboxes with larger data lengths, thus improving the transmission efficiency of big data.

7.4.4 Process Data Object (PDO)

PDO Introduction

PDO is generally used for real-time data updates. It is divided into receiving PDO (RXPDO) and sending PDO (TXPDO). The data stream direction of receiving PDO is from master station to slave station, while sending PDO is from slave station to master station

The PDO function of OSD-H-*-E supports both synchronous cycle mode and non-periodic update mode. When distributed clock synchronization mode is selected on master station, PDO will update according to the synchronization cycle. If free moving mode is selected, PDO data updates aperiodic.

PDO mapping

Through PDO mapping, the real-time transmission of mapped objects can be realized.

OSD-H-*-E supports simultaneous transmission of 2 sets of RXPDO and 2 sets of TXPDO. Each PDO object can map up to 8 object dictionary (maximum length 32 bytes). The format of PDO mapping content is shown in table 6.2

Table 7.2 Format of PDO mapping

Bit	31~16	15~8	7~0
Description	Index of mapped object	Subindex of mapped object	Bit length (Hex)
Example	6040h	00h	10h(16bit)

Default PDO mapping (consistent with the XML file) is shown in table 7.3

Table 7.3 Default PDO mapping

PDO Map object index	PDO Map object Sub-index	Mapping content	Mapped Object			Description
			Index	Sub-index	Bit length	
RXPDO1 (1600h)	01h	60400010h		00h	10h(16 bit)	01h
	02h	607A0020h		00h	10h(16 bit)	02h
	03h	60B80020h		00h		03h
RXPDO2 (1601h)	01h	60400010h	6040h	00h	10h(16 bit)	Control word
	02h	60FF0020h	60FFh	00h	20h(32 bit)	Target velocity
	03h	60B20010h	60B2h	00h	10h(16 bit)	Torque feedforward
RXPDO3 (1602h)	01h	60400010h	6040h	00h	10h(16 bit)	Control word
	02h	60710010h	6071h	00h	10h(16 bit)	Target torque
	03h	60870020h	6084h	00h	20h(32 bit)	Profile deceleration
	01h	60400010h	6040h	00h	10h(16 bit)	Control word

	02h	60980008h	6098h	00h	08h(8 bit)	Homing method
	03h	60990120h	6099h	01h	20h(32 bit)	High homing velocity
	04h	60990220h	6099h	02h	20h(32 bit)	Low homing velocity
	05h	609A0020h	609Ah	00h	20h(32 bit)	Homing acceleration
	06h	607C0020h	607Ch	00h	20h(32 bit)	Homing position offset
	07h	60600008h	6060h	00h	08h(8 bit)	Operation mode
TXPDO1 (1A00h)	01h	603F0000h				
	02h	60410000h				
	03h	60610000h				
	04h	60640000h				
	05h	60B90020h				
	06h	60BA0020h				
	07h	60FD0020h				
TXPDO2 (1A01h)	No default mapping					

PDO dynamic mapping

Different from CIA DS301, CoE uses PDO specified objects (1C12h/1C13h) to configure PDO mapped objects (1600h~1603h/1A00h~1A01h) to PDO SyncManager (SyncManager 2/3).

PDO specified objects are defined in table 6.4

Table 6.4 PDO specifies object definitions

Index	Sub-index	Range	Data type	Access
RXPDO (1C12h)	00h	0~4	U8*1)	RO *2)
	01h	1600h~1603h	U16	RW
	02h		U16	RW
	03h		U16	RW
	04h		U16	RW
TXPDO (1C13h)	00h	0~2	U8	RO
	01h	1A00h~1A01h	U16	RW
	02h		U16	RW

** 1) U represents unsigned type, such as U8 for unsigned 8 bits and U16 for unsigned 16 bits

2) Access: RO = Read Only, RW = Read and Write, WO = Write Only

PDO dynamic mapping setup procedure

A. Switch EtherCAT state machine to pre-operational, then PDO map can be configured using SDO.

B. Clear the PDO mapping object of the PDO specified object by setting 1C12-00h / 1C13-00h to 0.

C. Invalidate the PDO mapping object by assigning 0 to the subindex 0 of 1600h~1603h /1A00h~1A01h.

D. Reconfigure PDO mapping content and write the mapping object into the objects in the range of 1600-01h~1600-08h, 1601-01h~1601-08h, 1602-01h~1602-08h, 03-01h~1603-08h (RXPDO mapping content as from 1600h-01), 00-01h ~ 1A00-08h or 1A01-01h~1A01-08h (TXPDO mapping content as from 1A00h-01) according to Table 6.3

E. Set the total number of PDO mapping objects by writing the number of mapping objects into 1600-00h, 1601-00h, 1602-00h, 1603-00h, 1A00-00h or 1A01-00h. The total number of PDO mapping objects without mapping content will be set to 0.

F. Write valid PDO mapping object index to PDO specified object by writing valid RXPDO mapping object index 1600h~1603h into 1C12-01h ~ 1C12-04h and writing valid TXPDO mapping object index 1A00h, 1A01h into 1C13-01h, 1C13-02h.

G. Set the total number PDO specified objects by writing the number of mapped objects to 1C12-00h and 1C13-

00h.

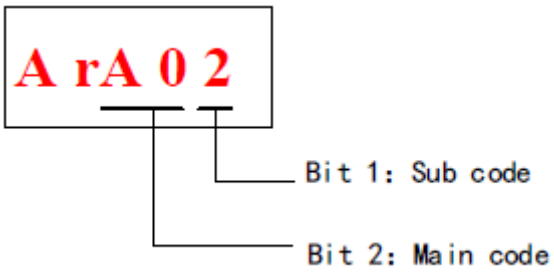
H. Switch EtherCAT state to Safe-Operational or above, the configured PDO mapping will be valid.

Chapter 8 Warning and Alarm

8.1 Servo drive warning

When warning occurs, driver will set protective function but motor won't stop moving. Error code will be displayed on the front Panel.

Example of warning code:



Warning Code		Content
Main	Code	
A0	1	Overload warning
	2	Regeneration energy overload warning(85% of the regeneration threshold)
	3	Absolute encoder battery voltage low (<3.1V). Valid when Pr0.15 is set to 1.
	4	Change the Parameter to a non-real time valid warning
	5	Pr0.01 is not 9 under current control mode, please correct this Parameter

8.2 Servo drive alarm

When alarm occurs, driver will set protective function and motor stops moving.

Error code will be displayed on the front Panel. Alarm history record can also be viewed in

data monitoring mode, with the alarm log sub-menu displaying "d12Er".

8.4 Alarm Handling

***When error occurs, please solve accordingly. Then, restart. If the solutions described don't work, please consider replacing the driver.*

Error code	Main	Sub	**Display:** "Er 090"--"Er 09F"	
	09	0~F	**Content:** FPGA communication error	
Cause			Diagnosis	Solution
L1, L2 terminal voltage too low			Verify L1, L2 terminal voltage	Make sure L1, L2 terminal voltage is within recommended range

Error code	Main	Sub	**Display:** "Er 0A0"--"Er 0A1"	
	0A	0~1	**Content:** Circuit current detection error	
Cause			Diagnosis	Solution
Motor power cable wiring error			Verify motor power cable wiring	Make sure U,V,W terminal wired properly
Main power supply undervoltage			Verify L1,L2,L3 terminal voltage	Increase main power supply voltage

Error code	Main	Sub	**Display:** "Er 0A2" / "Er 0A4"	
	0A	2 / 4	**Content:** Analog input error	
Cause			Diagnosis	Solution
Analog input wiring error			Verify analog input wiring	Make sure of analog input wiring connection

Error code	Main	Sub	**Display:** "Er 0A3"	
	0A	3	**Content:** Motor power cable not connected	
Cause			Diagnosis	Solution
Motor power cable not connected			Verify motor power cable wiring	Measure **resistance values between U, V, W terminals**, make sure the values are almost equal. If not, might be due to damaged motor or motor winding open circuit.
Motor fault			/	Replace motor

Error code	Main	Sub	**Display:** "Er 0A5"	
	0A	5	**Content:** DC Bus error	
Cause			Diagnosis	Solution
L1, L2 terminal voltage too low			Verify L1, L2 terminal voltage. Check if power on indicator light on servo drive is on and d27 DC bus voltage.	Make sure L1, L2 terminal voltage is within recommended range

Error code	Main	Sub	Display: "Er 0A6"
	0A	6	**Content:** Temperature measuring error
Cause		Diagnosis	Solution
L1, L2 terminal voltage too low		Verify L1, L2 terminal voltage	Make sure L1, L2 terminal voltage is within recommended range

Error code	Main	Sub	Display: "Er 0b0"
	0b	0	**Content:** Control circuit power supply voltage too low
Cause		Diagnosis	Solution
Control circuit power supply voltage too low		Verify L1C, L2C terminal voltage; check if wiring connection is tight	Increase L1C, L2C terminal voltage; Tighten L1C, L2C terminal connection
Power supply under capacity		/	Increase power supply capacity for L1C, L2C terminals

Error code	Main	Sub	Display: "Er 0b1"
	0b	1	**Content:** Control circuit power supply abnormal
Cause		Diagnosis	Solution
USB power supply too low		Verify if USB cable is properly connected and not damaged.	Replace USB Type-C cable

Error code	Main	Sub	Display: "Er 0c0"
	0c	0	**Content:** DC bus overvoltage
Cause		Diagnosis	Solution
Main power supply overvoltage		Verify L1,L2,L3 terminal voltage	Decrease main power supply voltage
Acceleration/deceleration time too short		Verify if the time is actually too short	Increase the duration time or change to a regenerative resistor with higher resistance.
Regenerative brake parameter anomaly		Verify Pr7.32/Pr7.33	Modify vent overload parameter
Inner brake circuit damaged		/	Replace driver

Error code	Main	Sub	Display: "Er 0d0"
	0d	0	**Content**: DC bus undervoltage
Cause		Diagnosis	Solution
Main power supply undervoltage		Verify L1,L2,L3 terminal voltage	Increase main power supply voltage
L1C, L2C connected when USB cable is connected		Control circuit power on before driver initialization. Alarm might occur.	Please disconnect the USB cable before powering on control circuit.

Error code	Main	Sub	Display: "Er 0d1"
	0d	1	**Content**: Single phasing of main power supply
Cause			Diagnosis	Solution
Main power supply undervoltage			Verify L1,L2,L3 terminal voltage	Increase main power supply voltage
Main power supply wiring error			Loose connection of L1, L2, L3	Secure connections

Error code	Main	Sub	Display: "Er 0d2"
	0d	2	**Content**: No main power supply detected
Cause			Diagnosis	Solution
No main power supply			Verify L1,L2,L3 terminal voltage	1. Increase main power supply voltage 2. Secure connections

Error code	Main	Sub	Display: "Er 0E0"
	0E	0	**Content:** Overcurrent
Cause			Diagnosis	Solution
Driver power output short circuit			Verify if there is short circuit between UVW terminals, or shorted to PG.	1. Make sure there is no circuit. 2. Make sure motor is not damaged
Motor wiring error			Verify motor wiring	Reconnect motor wiring
IGBT module short circuit			Disconnect motor output cable. Then, enable servo driver to check for overcurrent	Replace driver
Control parameter anomaly			Verify if parameter exceeds recommended range	Set parameter within recommended range.
Control command anomaly			Verify if command motion is too acute	Modify control command; use filter

Error code	Main	Sub	Display: "Er 0E1"
	0E	1	**Content**: Intelligent Power Module (IPM) overcurrent
Cause			Diagnosis	Solution
Driver power output short circuit			Verify if there is short circuit between UVW terminals, or shorted to PG.	1. Make sure there is no circuit. 2. Make sure motor is not damaged
Motor wiring error			Verify motor wiring	Reconnect motor wiring
IGBT module short circuit			Disconnect motor output cable. Then, enable servo driver to check for overcurrent	Replace driver
IGBT module undervoltage			/	Replace driver
Control parameter anomaly			Verify if parameter exceeds recommended range	Set parameter within recommended range.
Control command anomaly			Verify if command motion is too acute	Modify control command; use filter

Error code	Main	Sub	Display: "Er 0E2"
	0E	2	**Content**: Power output to motor shorted to ground

Cause	Diagnosis	Solution
Driver U, V, W terminals shorted to ground	Disconnect motor power cable and check for short circuit between driver UVW and PE	1. Reconnect wiring. 2. Change motor power cable.
Motor shorted to ground	Connect motor power cable to driver power output. Verify if resistance value of UVW to PE is in the range of MegaOhm (MΩ)	Replace motor

Error code	Main	Sub	Display: "Er 0E4"
	0E	2	**Content**: Phase overcurrent

Cause	Diagnosis	Solution
Driver U, V, W terminals shorted to ground	Disconnect motor power cable and check for short circuit between driver UVW and PE	1. Reconnect wiring. 2. Change motor power cable.
Motor shorted to ground	Connect motor power cable to driver power output. Verify if resistance value of UVW to PE is equal and if there is short circuit	Replace motor

Error code	Main	Sub	Display: "Er 0F0"
	0F	0	**Content**: Driver overheated

Cause	Diagnosis	Solution
Temperature of power module exceeded upper limit	Measure the temperature of driver radiator.	1. Improve cooling condition. Please check installation guide; 2. Replace driver and motor with higher power rating; 3. Increase duration time for acceleration and deceleration; 4. Decrease load

Error code	Main	Sub	Display: "Er 100"
	10	0	**Content:** Motor overloaded

Cause	Diagnosis	Solution
Load too heavy	Verify if actual load exceeds maximum value allowed	1. Decrease load 2. Adjust limit values
Strong mechanical vibration	Look for mechanical vibration from machine system	1. Adjust gain value of control loop 2. Increase duration time for acceleration and deceleration
Motor or encoder cable wiring error	Verify motor and encoder wiring	1. Reconnect wiring 2. Replace motor and encoder cable
Holding brake engaged	Verify holding brake terminal voltage	Cut off holding brake

Error code	Main	Sub	Display: "Er 101"
	10	1	**Content:** Driver overloaded

Cause	Diagnosis	Solution
Motor power cable wiring error	UVW terminals wiring error	Make sure motor power cable wiring connection is correct
Motor not matched	Motor current is too high	Motor rated current is higher than driver rated current. Please change to a driver with higher rated current.

Error code	Main	Sub	Display: "Er 102"
	10	2	**Content:** Motor rotor blocked

Cause	Diagnosis	Solution
Motor rotor blocked	Look for mechanical blockages	Check the machinery
Motor rotor blocking time threshold value too low	Verify value of Pr6.57	Adjust value of Pr6.57

Error code	Main	Sub	Display: "Er 120"
	12	0	**Content:** Regenerative resistor overvoltage

Cause	Diagnosis	Solution
Regenerative energy exceeded capacity of regenerative resistor	1. Verify if velocity is too high 2. Verify if load is too large	1. Decrease motor rotational velocity; 2. Decrease load inertia; 3. Add an external regenerative resistor;
Power supply voltage too high	1. Verify if power supply voltage is within the rated range. 2. Interval regenerative resistor value is too low	1. Decrease power supply voltage 2. Increase regeneration resistance value(add external regenerative resistor)
Unstable power supply voltage	Verify if power supply voltage is stable	Add a surge suppressor to main power supply.
Regenerative energy discharge circuit damaged	/	1. Add an external regenerative resistor; 2. Replace driver

Error code	Main	Sub	Display: "Er 121"
	12	1	**Content:** Holding brake error

Cause	Diagnosis	Solution
Holding brake circuit damaged	Regenerative resistor disconnected	Replace regenerative resistor
	Holding brake IGBT damaged	Replace driver

Error code	Main	Sub	Display: "Er 122"
	12	2	**Content:** Regenerative resistor value too low

Cause	Diagnosis	Solution
External regenerative resistor value is less than the minimum value allowed by the drive	/	Replace the regenerative resistor with the right resistance value which meets the specification of the driver

Error code	Main	Sub	Display: "Er 150"
	15	0	**Content:** Encoder disconnected

Cause	Diagnosis	Solution
Encoder cable disconnected	Verify encoder cable connection	Make sure encoder cable properly connected
Encoder cable wiring error	Verify if encoder wiring is correct	Reconnect encoder wiring
Encoder damaged	/	Replace motor
Encoder measuring circuit damaged	/	Replace driver

Error code	Main	Sub	Display: "Er 151"
	15	1	**Content:** Encoder communication error

Cause	Diagnosis	Solution
Encoder wire shielding layer is missing	Verify if encoder cable has shielding layer	Replace with standard encoder cable
Encoder cable wiring error	Verify if encoder wiring is correct	Reconnect encoder wiring
Encoder damaged	/	Replace motor

Error code	Main	Sub	Display: "Er 152"
	15	2	**Content:** Encoder initial position error

Cause	Diagnosis	Solution
Communication data abnormal	1. Verify if encoder power supply voltage is DC5V ⍰ 5%; 2. Verify if encoder cable and shielded layer is not damaged; 3. Verify if encoder cable is close to high-powered power supply cable	1. Make sure encoder power supply voltage is stable 2. Make sure encoder cable is not damaged. 3. Make sure encoder cable shielded layer is grounded to frame 4. Make sure encoder cable is away from high-powered power supply cable
Encoder damaged	/	Replace motor
Encoder measuring circuit damaged	/	Replace driver

Error code	Main	Sub	Display: "Er 153"
	15	3	**Content:** Multiturn encoder error

Cause	Diagnosis	Solution
Initial use	Origin calibration not performed	Perform origin positioning and multiturn position initialization, calibrate the origin of coordinate system.
Encoder without multiturn absolute function used	Verify if encoder has multiturn absolute function	1. Replace the motor with a multiturn absolute encoder. 2. Set Pr0.15 = 0 to deactivate multiturn absolute function.
Low battery power	Replace battery and restart driver to clear alarm	Replace battery
Battery has no power or has been dismantled	Alarm not cleared after replacing battery and restart	Absolute position lost. Return to origin and perform multiturn initialization, calibrate the origin of coordinate system

Error code	Main	Sub	Display: "Er 154"
	15	4	**Content:** Encoder parameter settings error

Cause	Diagnosis	Solution
Absolute encoder mode is incorrectly set.	Verify if encoder has multi-turn absolute value function.	Modify absolute encoder mode settings

Error code	Main	Sub	Display: "Er 155"
	15	5	**Content:** Encoder data overflow

Cause	Diagnosis	Solution
Encoder data overflow	Verify if encoder is not damaged	Initialize multiturn data
Absolute value applications, motor rotates in one direction	Verify if encoder is not damaged	Adjust absolute value application mode, set to turntable mode

Error code	Main	Sub	Display: "Er 156"
	15	6	**Content:** Encoder overheated

Cause	Diagnosis	Solution
The encoder temperature is too high.	Verify if motor temperature is too high	Reduce encoder temperature.

Error code	Main	Sub	Display: "Er 157"
	15	7	**Content:** Encoder counter error

Cause	Diagnosis	Solution
Encoder data overflow	Verify if encoder is not damaged	Initialize multiturn data
Absolute value applications, motor rotates in one direction	Verify if encoder is not damaged	Adjust absolute value application mode, set to turntable mode

Error code	Main	Sub	Display: "Er 170"
	17	0	**Content:** Encoder data error

Cause	Diagnosis	Solution
Communication data abnormal	1. Verify if encoder power supply voltage is DC5V ± 5%; 2. Verify if encoder cable and shielded layer is not damaged; 3. Verify if encoder cable is close to high-powered power supply cable	1. Make sure encoder power supply voltage is stable 2. Make sure encoder cable is not damaged. 3. Make sure encoder cable shielded layer is grounded to frame 4. Make sure encoder cable is away from high-powered power supply cable
Encoder damaged	/	Replace motor
Encoder measuring circuit damaged	/	Replace driver

Error code	Main	Sub	Display: "Er 171"
	17	1	**Content:** Encoder parameter initialization error

Cause	Diagnosis	Solution
Driver and motor not matched	Verify driver and motor models.	Replace with matching driver and motor
Error while getting parameters from encoder	1. Verify if encoder cable is standard. 2. Verify if encoder has no peeled insulator, broken connection or improper contact.	Use standard encoder cable, verify the connection of both sides of driver and motor, change encoder cable if necessary

Error code	Main	Sub	Display: "Er 180"
	18	0	**Content:** Excessive position deviation

Cause	Diagnosis	Solution
Improper position deviation settings	Verify if value of Pr_014 is too low	Increase value of Pr_014
Position gain setting too low	Verify if values of Pr1.00 & Pr1.05 are too low	Increase values of Pr1.00 & Pr1.05
Torque limit too low	Verify if values of Pr0.13 & Pr5.22 are too low	Increase values of Pr0.13 & Pr5.22
Excessive external load	1. Verify if acceleration and deceleration duration time is too low. 2. Verify if rotational velocity is too high 3. Verify if load is too large	1. Increase duration time for acceleration and deceleration 2. Decrease rotational velocity 3. Decrease load

Error code	Main	Sub	Display: "Er 181"
	18	1	**Content:** Excessive velocity deviation

Cause	Diagnosis	Solution
Deviation between set velocity and actual velocity is too great	Verify if value of Pr6.02 is too low	1. Increase value of Pr6.02; 2. Set Pr6.02 to 0, position error detection off.

Acceleration and deceleration duration time for set velocity is too low	Verify if value of Pr3.12 and Pr3.13 are too low	1. Increase value of Pr3.12, Pr3.13; 2. Adjust velocity gain to reduce velocity lag error

Error code	Main	Sub	**Display:** "Er 190"
	19	0	**Content:** Vibration too strong

Cause	Diagnosis	Solution
Resonance	Mechanical stiffness is too high, resonance occurs	Reduce mechanical stiffness or use filter
Current loop gain too large	Verify current loop gain value	Reduce current loop gain

Error code	Main	Sub	**Display:** "Er 191"
	19	1	**Content:** Excessive hybrid position deviation

Cause	Diagnosis	Solution
Driver UVW terminal output single phasing or wiring error	Verify if UVW terminal wiring connection is right	Make sure UVW terminals are correctly connected to UVW of motor; change motor power cable.
Motor rotor blocked	Look for mechanical blockages	Check the machinery
Driver stiffness too low	Verify if position loop and velocity loop gain is too low	Increase position loop and velocity loop gain

Error code	Main	Sub	**Display:** "Er 1A0"
	1A	0	**Content:** Overspeed

Cause	Diagnosis	Solution
Motor velocity exceeded first speed limit (Pr3.21)	1. Verify if velocity command is too high; 2. Verify if simulated velocity command voltage is too high; 3. Verify if parameter value of Pr3.21 is too low; 4. Verify if input frequency and division frequency coefficient of pulse train is proper; 5. Verify if encoder is wired correctly	1. Adjust velocity input command; 2. Increase Pr3.21 value; 3. Adjust pulse train input frequency and division frequency coefficient; 4. Verify encoder wiring;

Error code	Main	Sub	**Display:** "Er 1A1"
	1A	1	**Content:** Velocity out of control

Cause	Diagnosis	Solution
Motor velocity out of control, Excessive velocity error	Verify encoder phase sequence; Verify if UVW cable is connected to the right terminal	Reconnect UVW if wrongly connected. If still remains unsolved, please contact technical support.

Error code	Main	Sub	**Display:** "Er 1b0"
	1b	0	**Content:** Bus input signal dithering

Cause	Diagnosis	Solution

Controller synchronization dithering	/	Increase alarm threshold value

Error code	Main	Sub	Display: "Er 1b1"
	1b	1	**Content:** Incorrect electronic gear ratio
Cause		Diagnosis	Solution
Values out of range		Numerator or denominator is zero/Set values out of range	Reduce number of pulses per revolution

Error code	Main	Sub	Display: "Er 1b4"
	1b	4	**Content:** Excessive synchronous position mode command
Cause		Diagnosis	Solution
Values out of range		Numerator or denominator is zero/Set values out of range	Reduce number of pulses per revolution

Error code	Main	Sub	Display: "Er 210"
	21	0	**Content:** I/O input interface assignment error
Cause		Diagnosis	Solution
Input signal assigned with two or more functions.		Verify values of Pr4.00-Pr4.09, Pr4.44-4.47	Set proper values for Pr4.00-Pr4.09, Pr4.44-4.47

Error code	Main	Sub	Display: "Er 211"
	21	1	**Content:** I/O input interface function assignment error
Cause		Diagnosis	Solution
Input signal assignment error		Verify values of Pr4.00-Pr4.09, Pr4.44-4.47	Set proper values for Pr4.00-Pr4.09, Pr4.44-4.47

Error code	Main	Sub	Display: "Er 212"
	21	2	**Content:** I/O output interface function assignment error
Cause		Diagnosis	Solution
Input signal assigned with two or more functions.		Verify values of Pr4.10-Pr4.15	Set proper values for Pr4.10-Pr4.15
Input signal not assigned		Verify values of Pr4.10-Pr4.15	Set proper values for Pr4.10-Pr4.15

Error code	Main	Sub	Display: "Er 240"
	24	0	**Content:** CRC correction error during EEPROM parameter saving
Cause		Diagnosis	Solution
L1, L2 terminal voltage too low		Verify if L1, L2 terminal voltage too low	Make sure L1, L2 terminal voltage is within recommended range
Parameter saving anomaly		Save parameter again and restart	Save parameter again

Error	Main	Sub	Display: "Er 260"

code	26	0	**Content:** Positive/Negative position limit triggered under non-homing	
Cause			Diagnosis	Solution
Positive/negative position limit triggered			Verify position limit signal	/

Error code	Main	Sub	**Display:** "Er 270" -- "Er 272"	
	27	0~2	**Error description:** Analog input 1-3 out of range	
Cause			Diagnosis	Solution
Analog value out of range			Verify if analog input value is out of range	Adjust analog input voltage

Error code	Main	Sub	**Display:** "Er 280"	
	28	0	**Error description:** Output pulse frequency too high	
Cause			Diagnosis	Solution
Frequency divided pulse output exceeds 1MHz			Verify if motor rotational speed and the number of frequencies divided pulse output are too high	Reduce the number of frequency divided pulses output or reduce rotational speed

Error code	Main	Sub	**Display:** "Er 570"	
	57	0	**Error description:** Forced alarm input valid	
Cause			Diagnosis	Solution
Forced alarm input signal occurred			Verify forced alarm input signal	Verify if the input wiring connection is correct

Error code	Main	Sub	**Display:** "Er 5F0"	
	5F	0	**Content:** Motor model no. detection error	
Cause			Diagnosis	Solution
Automatically detected motor doesn't match set motor			/	Please contact our technical support

Error code	Main	Sub	**Display:** "Er 5F1"	
	5F	1	**Error description:** Driver power module detection error	
Cause			Diagnosis	Solution
Driver power rating not within range.			Restart driver	Please contact our technical support

Error code	Main	Sub	**Display:** "Er 600"	
	60	0	**Error description:** Main loop interrupted timeout	
Cause			Diagnosis	Solution
The motor control loop calculation time overflow			Check for interference from devices releasing electromagnetic field	Ground driver and motor to reduce interference
			Restart driver	Replace driver

Error code	Main	Sub	Display: "Er 601"
	60	1	**Error description:** Velocity loop interrupted timeout
Cause		Diagnosis	Solution
Motor control loop calculation time overflow		Verify if encoder connection is and that the encoder cable is too not long (more than 20 meters)	Replace encoder cable if necessary
		Restart driver	Replace the drive with a new one

Error code	Main	Sub	Display: "Er 700"
	70	0	**Error description:** Encryption error
Cause		Diagnosis	Solution
Encryption error during initialization upon power-on.		Restart driver	Please contact our technical support

Error code	Main	Sub	Display: "Er 890"
	89	0	**Error description:** Homing error
Cause		Diagnosis	Solution
1. Excess homing velocity 2. Homing mode is different from given signal 3. Sensor signal edge inconsistent		1. Verify if homing velocity is too high 2. Verify if homing mode is set correctly 3. Verify if sensor signal edge is consistent	1. Set an optimal homing velocity 2. Make sure sensor signal edge is consistent.
Inconsistent origin status		1. Homing acceleration/ deceleration is set too low 2. Electronic gear ratio is low which causes acceleration/ deceleration to be too low	1. If electronic gear ratio cannot be changed, please set a suitable 609A. 2. Increase electronic gear ratio

8.5 Alarm clearing

For alarm can be cleared. There are 3 method.

Method 1：

1、By setting bit 7 of 6040h to 1, switches state machine from fault to initialization completion , No fault(Switch on disabled).

Method 2：

Use auxiliary function "AF_ACL"

1、Press M to select auxiliary function , Press SET to enter into "AF_ACL" , Press and hold to clear the alarm

Method 3：

Set IO input function as Alarm clear input " (A-CLR)" , refer to switch input interface connection to clear the alarm.

8.6 EtherCAT Communication Alarm

EtherCAT communication related alarms are erasable and will not be recorded in alarm history.
Clearing EtherCAT communication alarm is similar to clearing servo driver alarm.
Please clear the alarm before switching to 402 machine state.
EtherCAT communication alarm however, relies on register clearance from the main station. Can be solved according to following steps:
1. Set bit 4 of ESC control register 0x120 (error responder) to 1.
2. The communication alarm can be cleared until the feedback of the ESC status code register 0x134~0x135 is 0.
3. By setting bit 7 of 6040h to 1, switches state machine from fault to initialization completion, No fault (Switch on disabled).

Error code	Main	Sub	**Display:** "Er 73A"
	73	A	**Error description:** SyncManager2 lost
Cause		Diagnosis	Solution
Poor master performance		--	Increase the alarm threshold
Single-unit drive has problem		Is it a single unit or multiple units together in the network	Switch drive
Interference		Check the grounding and network wiring quality	Replace the network cable

Error code	Main	Sub	**Display:** "Er 73b"
	73	B	**Error description:** SYNC0 lost
Cause		Diagnosis	Solution
Poor master performance		--	Increase threshold value limit
Single-unit drive has problem		Is it a single unit or multiple units together in the network	Switch drive
interfere		Check the grounding and network wiring quality	Replace the network cable

Error code	Main	Sub	**Display:** "Er 73c"
	73	C	**Error description:** Excessive Distributed Clock error
Cause		Diagnosis	Solution
Poor master device performance		--	Increase threshold value limit
Single-unit drive has problem		Is it a single unit or multiple units together in	

Error code	Main	Sub	**Display:** "Er 801"
	80	1	**Error description:** Unknown communication error
Cause			EtherCAT state machine transition failed
The status of the error can be detected			All ESM status
The result status			The current state is maintained below the safe operation, and the operation state is switched to the safe operation state
Solution			Verify network connection and master device EtherCAT state machine transition order

Error code	Main	Sub	Display: "Er 802"
	80	2	**Error description:** Memory overflow
Cause			CPU failed to request memory
The status of the error can be detected			All ESM status
The result status			The current state is maintained below the safe operation, and the operation state is switched to the safe operation state
Solution			Verify if OSD-H-*-E hardware is faulty

Error code	Main	Sub	Display: "Er 803"
	80	3	**Error description:** RAM out of bound
Cause			EtherCAT state machine memory address access request from master device is out of bound
The status of the error can be detected			All communication status
The result status			NO
Solution			Verify master device configuration or replace master device

Error code	Main	Sub	Display: "Er 805"
	80	5	**Error description:** FOE firmware upgrade failed
Cause			Firmware burn error
The status of the error can be detected			BOOT
The result status			Remain in the detection state
Solution			Replace firmware/driver

Error code	Main	Sub	Display: "Er 806"
	80	6	**Error description:** Saved ESI file does not match driver firmware
Cause			ESI file does not match driver firmware
The status of the error can be detected			INIT
The result status			Remain in the detection state
Solution			Burn matching firmware to driver

Error code	Main	Sub	Display: "Er 811"
	81	1	**Error description:** Invalid EtherCAT transition request
Cause			Driver received unconvertible request from EtherCAT state machine
The status of the error can be detected			All ESM Status
The result status			The current state is maintained below the safe operation, and the operation state is switched to the safe operation state
Solution			Verify if the transition information from master device is correct

Error code	Main	Sub	Display: "Er 812"
	81	2	**Error description:** Unknown EtherCAT state machine transition request
Cause			Driver receives a transition request other than states of the EtherCAT state machine
The status of the error can be detected			All ESM Status
The result status			The current state is maintained below the safe operation, and the operation state is switched to the safe operation state
Solution			Verify transition information from master device

Error code	Main	Sub	Display: "Er 813"
	81	3	**Error description:** Protection request from boot state
Cause			Driver receives a transition request to boot state
The status of the error can be detected			Initialize the conversion to a boot
The result status			initialization
Solution			Verify if driver software version supports this state transition

Error code	Main	Sub	Display: "Er 814"
	81	4	**Error description:** Invalid firmware
Cause			Firmware not matched with driver
The status of the error can be detected			BOOT/INIT
The result status			Keeping in the detection status
Solution			Return driver to supplier to update firmware

Error code	Main	Sub	Display: "Er 815"
	81	5	**Error description:** Invalid mailbox configuration under boot state
Cause			Boot state action not supported under current configuration
The status of the error can be detected			Initialize the conversion to a boot
The result status			Initialization
Solution			Verify if OSD-H-*-E software version supports action under this state.

Error code	Main	Sub	Display: "Er 816"
	81	6	**Error description:** Pre-Op status is invalid for the mailbox configuration
Cause			The synchronization manager configuration under Pre-Op is invalid
The status of the error can be detected			pre-operation
The result status			initialization
Solution			1. Verify if XML file version is consistent with software version EtherCAT slave controller error, please contact technical support

Error code	Main	Sub	Display: "Er 817"
	81	7	**Error description:** Invalid SyncManager configuration
Cause			Synchronization manager configuration is invalid
The status of the error can be detected			Pre-op above
The result status			Pre-op
Solution			Verify master device configuration/ESI file version

Error code	Main	Sub	Display: "Er 818"
	81	8	**Error description:** No valid input data
Cause			The input data is not updated for more than 1 second
The status of the error can be detected			All ESM status
The result status			The current state is maintained below the safe operation, and the operation state is switched to the safe operation state
Solution			1. Verify if TxPDO is valid 2. Verify master device synchronization settings

Error code	Main	Sub	Display: "Er 819"
	81	9	**Error description:** No valid output data
Cause			Output data is not updated for more than 1 second
The status of the error can be detected			All ESM status
The result status			The current state is maintained below the safe operation, and the operation state is switched to the safe operation state
Solution			1. Verify if RxPDO is valid 2. Verify master device synchronization settings

Error code	Main	Sub	Display: "Er 81A"
	81	A	**Error description:** Synchronization error
Cause			RxPDO and DC update order failed or one of them is not updated in sync
The status of the error can be detected			All ESM status
The result status			The current state is maintained below the safe operation, and the operation state is switched to the safe operation state
Solution			1. Verify if PXPDO is valid 3. Verify master device synchronization settings

Error code	Main	Sub	Display: "Er 81b"
	81	b	**Error description:** SyncManager2 watchdog timer timeout
Cause			The RxPDO update timeout in operational state
The status of the error can be detected			operation
The result status			Safe operation
Solution			1. Verify if OSD-H network is connected 4. Verify RxPDO update time

Error code	Main	Sub	Display: "Er 81c"
	81	c	**Error description:** Invalid SyncManager type
Cause			Synchronization Manager configuration types other than the following: 1. Email output 2. Email input 3. Process data output 4. Process data input
The status of the error can be detected			Pre-operation
The result status			Initialize
Solution			Verify if XML file version is consistent with software version

Error code	Main	Sub	Display: "Er 81d"
	81	d	**Error description:** Invalid output configuration
Cause			Process data output synchronization manager configuration is invalid
The status of the error can be detected			Pre-operation
The result status			Initialize
Solution			1. Verify OSD-H synchronization manager configuration Verify if XML file version is consistent with software version

Error code	Main	Sub	Display: "Er 81E"
	81	E	**Error description:** Invalid input configuration
Cause			Process data input synchronization manager configuration is invalid
The status of the error can be detected			Pre-operation
The result status			Initialize
Solution			1. Verify OSD-H synchronization manager configuration Verify if XML file version is consistent with software version

Error code	Main	Sub	Display: "Er 821"
	82	1	**Error description:** Waiting for EtherCAT state machine Init state
Cause			Driver waiting for master device to send Init request
The status of the error can be detected			All ESM status
The result status			Keeping the current state
Solution			Verify transition request sent from master device

Error code	Main	Sub	Display: "Er 822"
	82	2	**Error description:** Waiting for the EtherCAT state machine Pre-Op state
Cause			Driver waiting for master device to send Pre-Op request
The status of the error can be detected			Safe operation, operation
The result status			Keeping the current state
Solution			Verify transition request sent from master device

Error code	Main	Sub	Display: "Er 823"
	82	3	**Error description:** Waiting for master device for Safe-Op request
Cause			Process data output synchronization manager configuration is invalid
The status of the error can be detected			Operation
The result status			Keeping the current state
Solution			Verify transition request sent from master device

Error code	Main	Sub	Display: "Er 824"
	82	4	**Error description:** Invalid process data input mapping
Cause			TxPDO is configured with non-mappable objects
The status of the error can be detected			Safe operation
The result status			Pre-operation
Solution			Reconfigure the TxPDO mapping object

Error code	Main	Sub	Display: "Er 825"
	82	5	**Error description:** Invalid process data output mapping
Cause			RxPDO is configured with non- mappable objects
The status of the error can be detected			Safe operation
The result status			Pre-operation
Solution			Reconfigure the RxPDO mapping object

Error code	Main	Sub	Display: "Er 828"
	82	8	**Error description:** Sync mode not supported
Cause			Sync mode is not supported in the current configuration
The status of the error can be detected			Safe operation
The result status			Pre-operation
Solution			1. Verify OSD-H software version Verify XML version

Error code	Main	Sub	Display: "Er 82b"
	82	b	**Error description:** Invalid inputs and outputs
Cause			No RxPDO and TxPDO updates for more than 1 second
The status of the error can be detected			All ESM status
The result status			The current state is maintained below the safe operation, and the operation state is switched to the safe operation state
Solution			1. Verify if current RxPDO and TxPDO are invalid Verify master device synchronization settings

Error code	Main	Sub	Display: "Er 82c"
	82	c	**Error description:** Fatal synchronization error
Cause			DC watchdog timer timeout
The status of the error can be detected			Safe operation, operation
The result status			Safe operation
Solution			1. Verify if OSD-H-*-E hardware is faulty Verify DC setting and delay

Error code	Main	Sub	Display: "Er 82d"
	82	d	**Error description:** No synchronization error
Cause			Synchronization is invalid
The status of the error can be detected			operation
The result status			Safe operation
Solution			1. Verify if "fatal synchronization error" has occurred. Verify master device synchronization settings

Error code	Main	Sub	Display: "Er 82E"
	82	E	**Error description:** Synchronization cycle time is too short
Cause			Master device synchronization cycle time is set to less than 125 microseconds
The status of the error can be detected			operation
The result status			Pre-operation
Solution			Verify master device synchronization cycle time

Error code	Main	Sub	Display: "Er 830"
	83	0	**Error description:** Invalid Distributed Clock synchronization settings
Cause			Synchronization settings in sync mode are not valid
The status of the error can be detected			Safe operation
The result status			Pre-operation
Solution			Verify master device synchronization settings

Error code	Main	Sub	Display: "Er 832"
	83	2	**Error description:** Distribution Clock phase-locked loop failure
Cause			Distribution Clock phase-locked loop setting is invalid
The status of the error can be detected			Safe operation, operation
The result status			Safe operation
Solution			Verify master device Distribution Clock settings and network transmission delay

Error code	Main	Sub	Display: "Er 835"
	83	5	**Error description:** Distribution Clock cycle time is invalid
Cause			Set synchronization cycle time is not proportional to drive position loop
The status of the error can be detected			Safe operation
The result status			Pre-operation
Solution			Refer to user manual to set a reasonable synchronization cycle time.

Error code	Main	Sub	Display: "Er 836"
	83	6	**Error description:** Invalid Distribution Clock synchronization cycle time
Cause			The synchronization cycle time setting is not as the following 125us / 250us / 500us / 750us / 1000us / 2000us / 4000us
The status of the error can be detected			Safe operation
The result status			Pre-operation
Solution			Verify master device synchronization cycle time

Error code	Main	Sub	Display: "Er 850"
	85	0	**Error description:** EEPROM is inaccessible
Cause			EtherCAT slave controller failed to access EEPROM
The status of the error can be detected			All ESM status
The result status			Keeping the current state
Solution			1. Verify if OSD-H hardware is faulty 2. Verify if master device released access

Error code	Main	Sub	Display: "Er 851"
	85	1	**Error description:** EEPROM error
Cause			EEPROM operation of EtherCAT slave controller failed
The status of the error can be detected			All ESM status
The result status			Keeping the current state
Solution			Verify if master device released access

Error code	Main	Sub	Display: "Er 851"
	85	1	**Error description:** EEPROM error
Cause			EEPROM operation of EtherCAT slave controller failed
The status of the error can be detected			All ESM status
The result status			Keeping the current state
Solution			Verify if master device released access

Error code	Main	Sub	Display: "Er 852"
	85	2	**Error description:** Hardware is not ready
Cause			Data communication lost
The status of the error can be detected			All ESM status
The result status			Keeping the current state
Solution			Verify if OSD-H-*-E hardware is faulty

Error code	Main	Sub	Display: "Er 860"
	86	0	**Error description:** EtherCAT frame lost per unit time exceeds limit
Cause			EtherCAT frame lost per unit time exceeds the setting in 2635-00h
The status of the error can be detected			All status
The result status			Keeping the detection state
Solution			Change to network cable with higher bandwidth / Replace driver

Error code	Main	Sub	Display: "Er 870"
	87	0	**Error description:** Driver can't be enabled under current control mode
Cause			Enable driver under unsupported mode
The status of the error can be detected			All status
The result status			Maintain status
Solution			Switch to the correct control mode

Error code	Main	Sub	Display: "Er 890"	
	89	0	**Error description:** Homing Error	
Cause			Diagnosis	Solution
Homing velocity too high. Passed homing sensor before signal is captured			Verify if homing velocity is too high. Or set lower homing velocity	Decrease homing velocity or increase homing acceleration
Homing mode is not coincide with input signals			Verify if input signal from sensors are corresponding to the demands of chosen homing mode	Set up the signal input in accordance to homing mode settings
Unsupported homing mode			Verify if improper homing mode is set in object dictionary 6098h	Re-select homing mode
